16 Glossary

1 Welcome

StickStudio is an embroidery program (digitizing software) with which you create embroidery files yourself: logos, lettering, monograms, appliqués and more. It runs in the browser – no installation – and produces files for the embroidery machine.

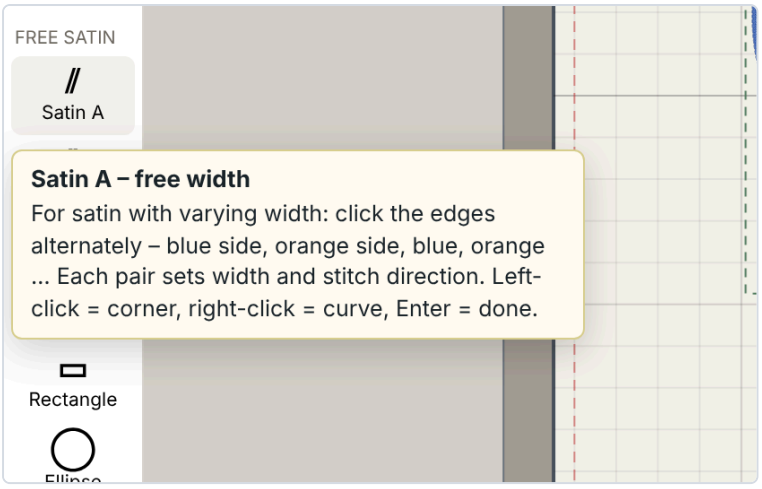

What can StickStudio do?

- **Drawing with two mouse buttons:** left click = corner, right click = curve. Satin with fixed or free width, fills, running stitches, shapes.
- **Fonts:** 28 ready-digitized embroidery fonts and 9 more fonts, plus monograms, text on a line, arcs and envelope shapes.
- **Automation:** density, pull compensation, underlay and stitch lengths are calculated from **fabric** and width.
- **Tools for professionals:** appliqué, knockdown, cap sorting, removing overlaps, combining shapes, team names, multiple hoopings.
- **Stitch check:** warns about too dense areas, long stitches and bad angles and suggests corrections.
- **Output:** DST (Texi 1501 and all Tajima-compatible), PES, JEF, EXP; worksheet, product preview on the garment and price calculation with quotation.
- **Garment templates:** T-shirt, polo, sweatshirt, hoodie, softshell jacket and cap as photos behind the hoop – you see and measure where the embroidery will sit later. Your own product photos can be stored.
- **Two languages:** German and English, switchable with the buttons **DE | EN** at the top right.

How the manual is organized

First the **quick start** – your first design in ten minutes. Then the **user interface** and the **operation**, every **tool** with picture and example, the **garment templates** for exact positioning, the **menus** with all commands and dialogs, many **recipes** for typical tasks and at the end **account & subscription**, **help with problems** and a **glossary**.

> 📌 **Note** Almost every button has an **info box**: hold the mouse over it and a short explanation appears. To switch it off: “Settings → Help info on hover” or the button ⓘ at the bottom right.

The info box appears when you let the mouse rest on a button.

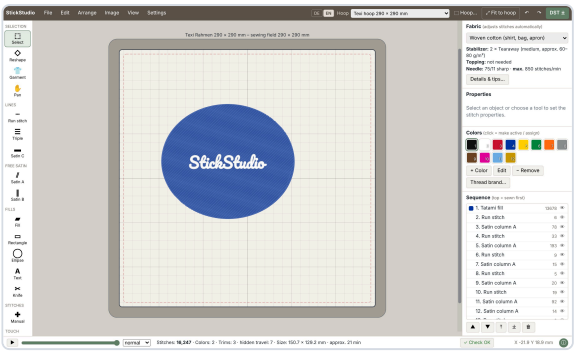

What you need

- A current browser (Chrome, Edge, Firefox or Safari).
- Preferably a **mouse with two buttons**: the left and the right button have different meanings when drawing. On a tablet there is the button “Curve”.
- An embroidery machine that can read DST, PES, JEF or EXP, and a USB stick for transfer.

2 Quick start: your first design

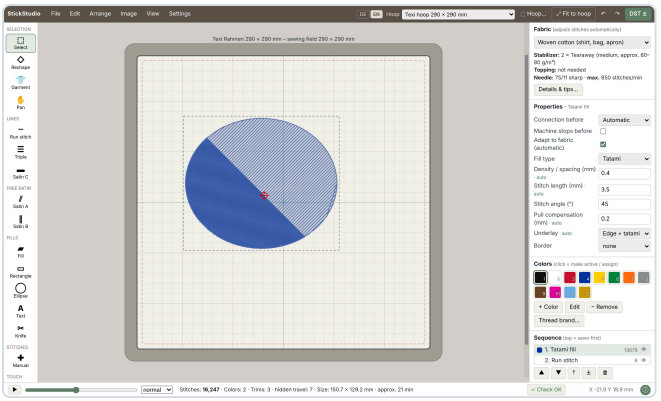

Your first embroidery design in ten steps: a club patch with a blue area and white lettering.

1. Open StickStudio and sign in (see chapter Account & subscription). At the top right you choose the language (**DE** or **EN**).
2. In the **Hoop** field (top) choose your embroidery hoop, e.g. “Texi hoop 290 × 290 mm”. The lighter area on the work area is the sewing field.
3. On the right under **Fabric** choose the fabric you embroider on (e.g. “Woven cotton”). Density and underlay adapt automatically.
4. In the **color palette** on the right choose a color, e.g. the blue. New objects get this color.
5. On the left choose the tool **Ellipse**, press the left mouse button on the work area and drag – a blue fill appears.
6. Choose the color **White**, then the tool **Text**, click in the middle of the ellipse and enter “StickStudio” in the dialog. Confirm with **Insert**.
7. Look at the result: click ▶ at the bottom left (**stitch simulation**) – you see in which order the machine sews.
8. At the bottom right **“Check OK”** shows that no problems were found. For yellow or red you click it and get suggestions for corrections.
9. Save the design as a project (**File → Save project**) – so it stays fully editable later – and store it in the **design library**.
10. At the top right click **DST ⭳**, choose the file format of your machine, **Save**. Copy the file to the USB stick and load it on the machine.

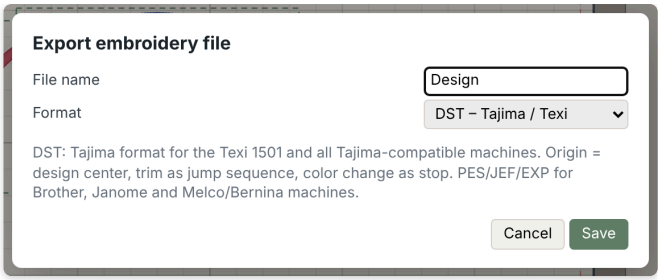

This is what the finished example looks like in StickStudio.

> 💡 **Tip** `Ctrl` + `Z` undoes every step – so you can try things out safely.

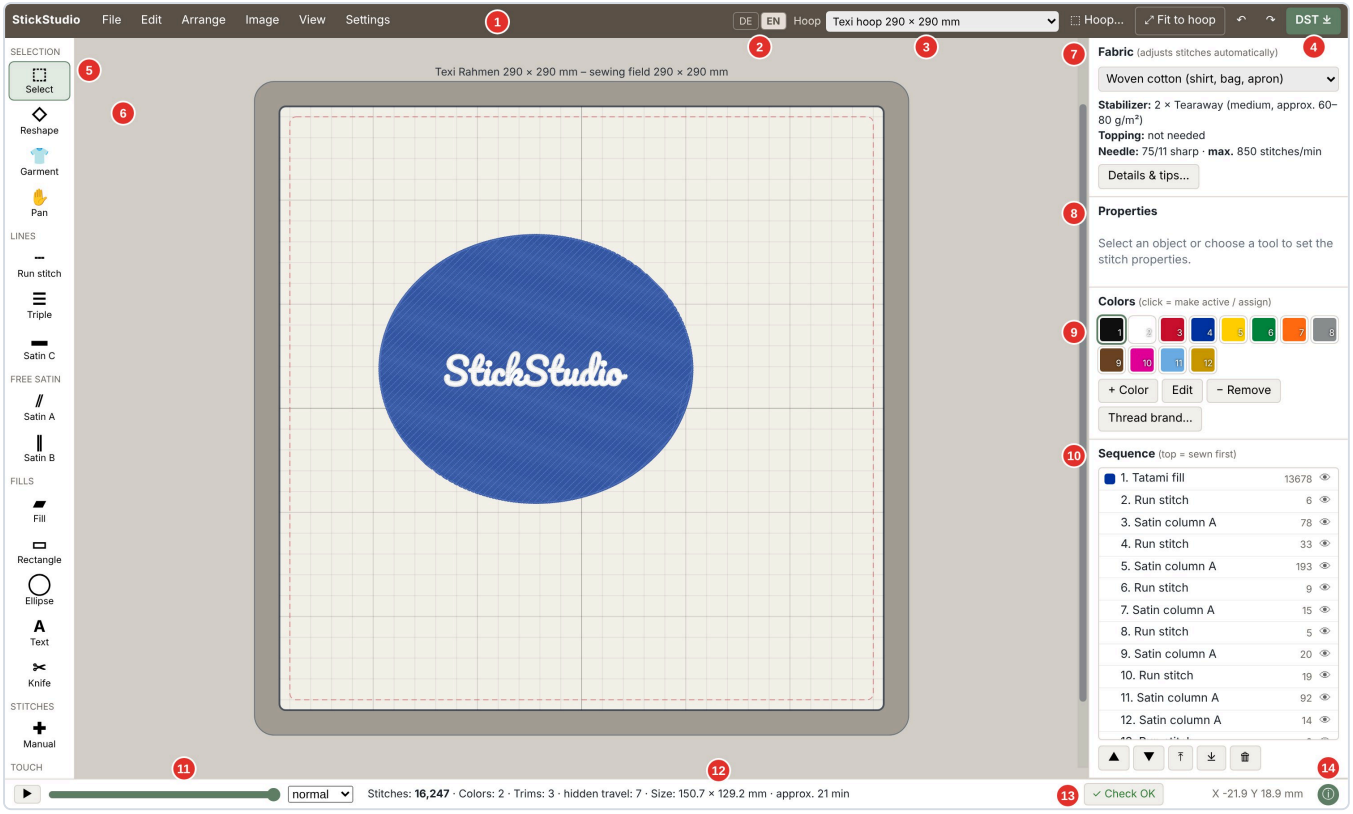

The stitch simulation shows the design stitch by stitch up to the middle.

The export dialog: choose file name and format.

3 The user interface

The interface is divided into fixed areas. The red numbers in the picture correspond to the list below.

The StickStudio interface with numbered areas.

1 **Menu bar:** File, Edit, Arrange, Image, View, Settings (and “Account” in the online version) – all commands of the program.

2 **Language DE | EN:** Switches the interface between German and English. The choice is remembered.

3 **Hoop:** Which embroidery hoop is used. Next to it “Hoop...” for managing and creating your own hoops, and “Fit to hoop”.

4 **Export button:** Quick way to the embroidery file for the machine (DST, PES, JEF, EXP). Next to it: undo ↶ and redo ↷.

5 **Toolbar:** All drawing and selection tools, grouped by selection, lines, free satin, fills, stitches and touch.

6 **Work area:** This is where the design is created: hoop, grid, objects. At the bottom a hint bar that names the next step.

7 **Fabric:** Choose the fabric. Density, pull compensation and underlay adapt; plus stabilizer, topper and needle recommendations.

8 **Properties:** All settings of the selected object: stitch type, density, angle, underlay, outline and more.

9 **Colors:** Thread colors of the design. Click = active color or assign to the selected object. The number is the needle number.

10 **Order:** All objects in sewing order (top first). Click selects, the eye hides; arrows change the order.

11 **Simulation:** ▶ plays the sewing order; slider and speed. If something is selected, only the selection runs.

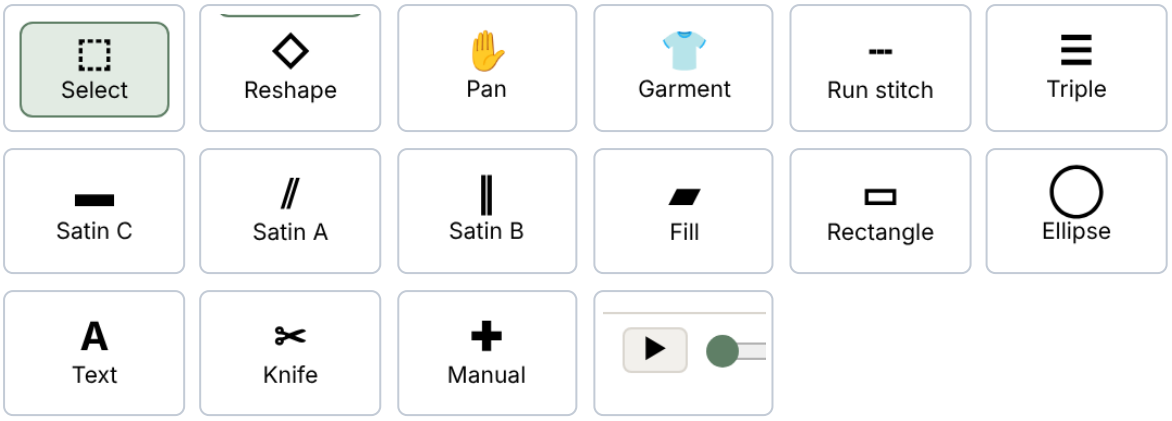

12 **Design data:** Stitch count, colors, trims, hidden paths, size and approximate sewing time.

13 **Stitch check:** “Check OK” = green. Yellow/red: clicking shows problems and corrections.

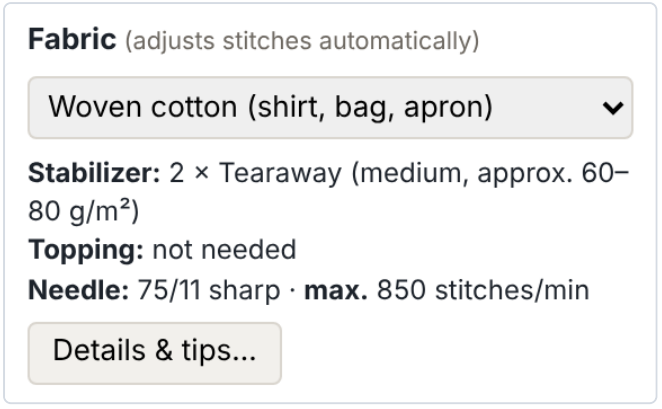

14 **Help info:** ⓘ switches the info boxes on hover on or off.

The areas in detail

Toolbar (left)

From top left: Select, Reshape, Pan, Garment, Running stitch, Triple, Satin C, Satin A, Satin B, Fill, Rectangle, Ellipse, Text, Knife, Manual, Curve.

Fabric

Color palette (number = needle number)

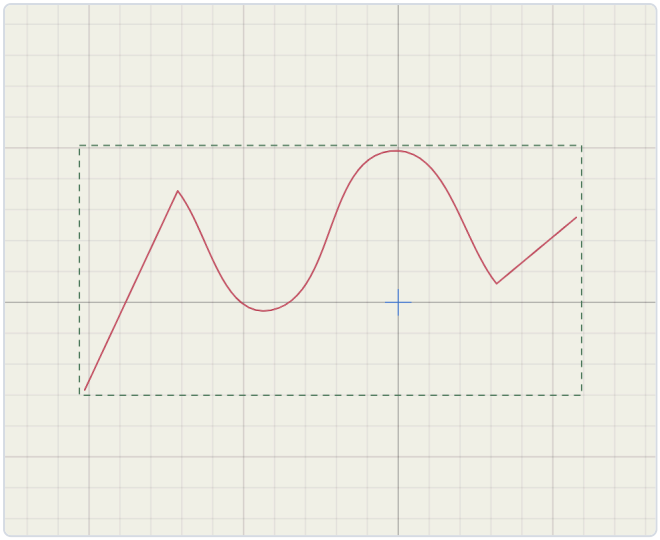

Status bar: simulation, design data, check, mouse position, help switch.

Menu bar with language switch, hoop selection, undo/redo and export.

4 Operation with mouse and keyboard

Every mouse button has a fixed meaning when drawing. Once you have internalized this, everything goes fast.

Left button = corner, right button = curve: this line has two curve points.

> 📌 **Note Left click = corner** (straight line)
> **Right click = curve** (curved line)
> **Enter** = done
> **Backspace** = last point back
> **Esc** = cancel

Input	Effect
Left click	Set a point (corner / straight line). With the select tool: select an object.
Right click	Set a curve point (curved line). With the manual tool: jump.
Enter	Finish the object or next step.
Backspace	Take back the last point.
Esc	Cancel and back to the select tool; clears the selection.
R	Reshape (edit points afterwards).
H	Pan (hand tool).
Space	While reshaping: switch a point between corner and curve. Otherwise: hold + move the mouse = pan the view.
Double click	While reshaping: insert a point. On text: edit the text.
Del	Delete point or object.
Arrow keys	Move the selection 0.1 mm (with Shift 1 mm). Without selection: pan the view. With the tool “Garment”: move the garment 1 mm (with Shift 10 mm).
Mouse wheel	Scroll the view up/down. `Shift` + wheel: left/right. `Ctrl` + wheel: zoom.
Middle button / Alt + drag	Pan the view.

0	Show everything.
T / J	TrueView (thread view) / show jumps.
G	Snap to grid and guides on/off.
Ctrl+Z / Ctrl+Y	Undo / redo.
Ctrl+D	Duplicate.
Ctrl+A	Select all.
Ctrl+G / Ctrl+Shift+G	Group / ungroup.
Ctrl+O / Ctrl+S	Open / save project.
Ctrl+B	Design library.
Ctrl+E	Export embroidery file.
Shift (when clicking)	Add to the selection. When dragging an ellipse: circle instead of ellipse.

> 💡 **Tip** The complete overview is also in the program under **Settings → Help / keyboard**.

Moving and zooming the view

There are several ways to move the view – use the one that suits you best: mouse wheel (up/down), `Shift` + wheel (left/right), swiping with two fingers on the trackpad, the scroll bars at the edge, the hand tool `H` or holding `Space` and moving the mouse. Zoom: `Ctrl` + wheel. If you prefer to zoom with the wheel, switch on **View → Wheel zooms**.

5 The tools

All tools of the left bar with a picture of the button, step-by-step instructions and an example.

Select

The standard tool: click objects, move them and select several at once. `Esc` takes you back here at any time.

1. Click an object – it gets a blue dashed frame and its **properties** appear on the right.
2. To move the object, drag it with the left mouse button held down.
3. Several objects: hold `Shift` and click more – or drag a frame around them with the mouse. `Ctrl`+`A` selects everything.
4. Double-clicking a text opens the text dialog for editing.
5. With the arrow keys you move the selection in 0.1 mm steps (with `Shift` in 1 mm steps).

The selected object shows a dashed frame (here in thread view).

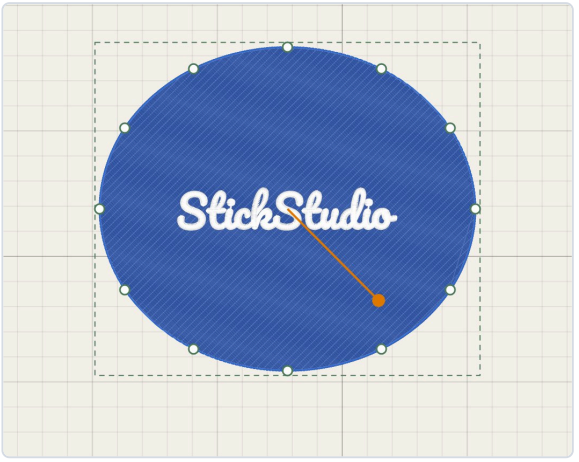

> 💡 **Tip** Wrong selection? `Esc` clears it. With the order list on the right you can also select objects that are hidden.

Reshape

Move, insert or delete single points of an object afterwards – for fine-tuning once an object has been drawn.

1. Select the object and click **Reshape** (or press `R`). The points of the object now appear as handles.
2. Drag a point with the mouse to change the shape. The stitches are recalculated immediately.
3. **Double-click** on the line inserts a new point.
4. Click a point and press `Del` to remove it.
5. `Space` on a point switches between **corner** (sharp) and **curve** (round).
6. On fills, an orange handle shows the **stitch angle** – dragging it rotates the stitch direction.

The handle points of the shape are visible and can be dragged.

Pan (hand)

Moves the view in any direction – for a large design or when you have zoomed in a lot.

1. Click **Pan** (or press `H`) and drag with the mouse button held down.
2. **Without switching tools:** hold `Space` and move the mouse – the view follows.
3. **Mouse wheel** = up/down, `Shift` + wheel = left/right, `Ctrl` + wheel = zoom. On a trackpad, swipe with two fingers.
4. At the edge of the work area there are scroll bars you can drag as well.

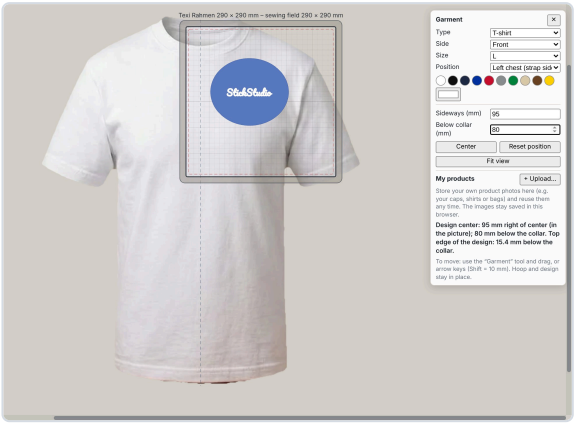

> 💡 **Tip** `0` shows the whole design, “View → Show hoop” shows the whole embroidery hoop.

Move garment

Turns the garment template on and moves the garment **under the hoop**. Hoop and design stay put – this is how you find the exact spot for the embroidery.

1. Click **Garment** (or use the menu **File → Garment template…**). The **Garment** window opens on the right of the work area.
2. Drag with the mouse button held down: the garment moves under the hoop, the design stays where it is.
3. Fine steps: the arrow keys move by 1 mm, with `Shift` by 10 mm.
4. The window shows how far the **design center** is from the center line and from the collar (in mm). You can also type the values there.
5. `Esc` or another tool ends moving; the garment stays visible until you click ✕ in the window.

The design sits on the left chest; the window on the right shows the distances.

> 💡 **Tip** Detailed instructions in the chapter Garment templates.

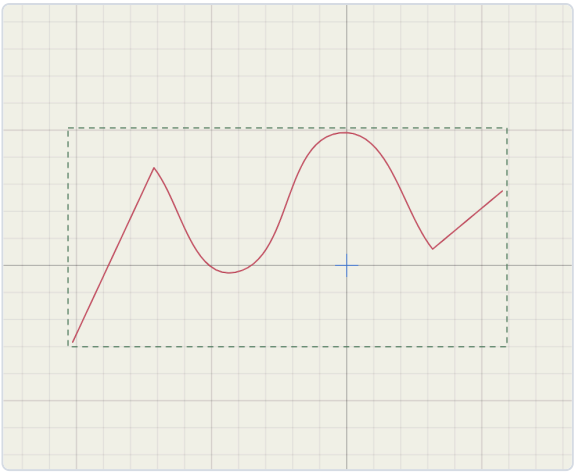

Running stitch

Run stitch

A simple stitch line – for outlines, fine details, lines and for drawing guide lines.

1. Choose the tool and set the first point (corner) with the **left mouse button**.
2. More points: **left click = corner** (straight line), **right click = curve point** (curved line).
3. `Backspace` takes back the last point, `Esc` cancels.
4. `Enter` ends the line – done.
5. On the right under “Properties” you can choose: running stitch / triple stitch / bean stitch, stitch length and whether the line is closed.

> 💡 **Tip** A stitch length of 2–3 mm is usual. For fine curves use 1.5 mm.

A line with two curve points (right mouse button) and several corners (left mouse button).

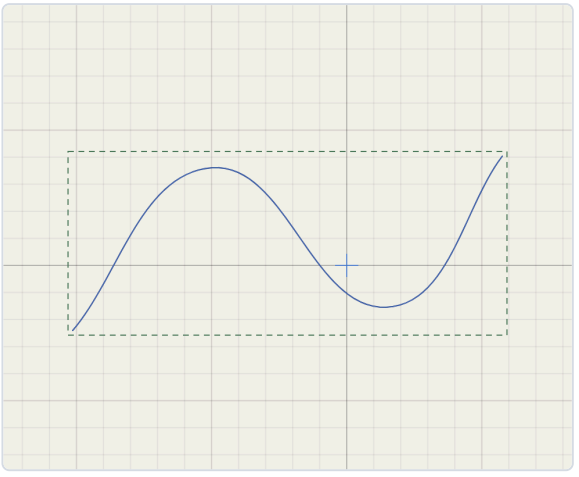

Triple stitch

Triple

Like the running stitch, but every stitch is sewn three times – strong, clearly visible, good for thin outlines.

1. Operation exactly as with the running stitch: left click = corner, right click = curve, `Enter` = done.
2. The triple stitch needs three times as many stitches as a running stitch – on long lines you notice this in the stitch time.

> 💡 **Tip** For even stronger lines: satin C with 1.5–2 mm width.

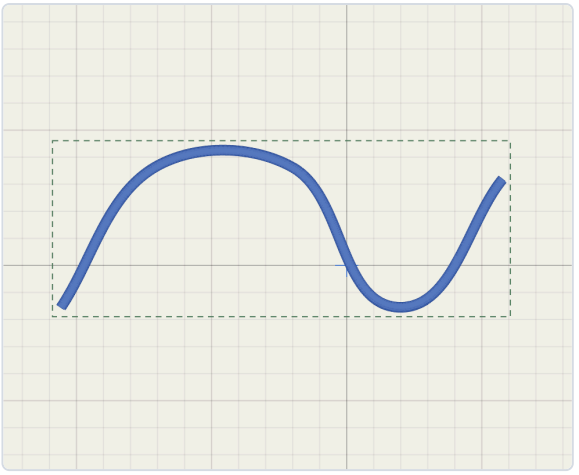

Triple-stitch line with two curve points.

Satin C – fixed width

Satin C

A satin column with **constant width** along a line. Ideal for borders, frames and lettering.

1. Choose the tool “Satin C”.
2. Draw the **center line**: left click = corner, right click = curve. `Enter` ends.
3. On the right in the properties set the **width in mm** (well stitchable: 1.5–8 mm). Wider satins are split automatically.
4. The program calculates density, pull compensation and underlay from fabric and width by itself.
5. Should the width vary in places later? Then use **Edit → Convert to Satin A** and drag the edges with “Reshape”.

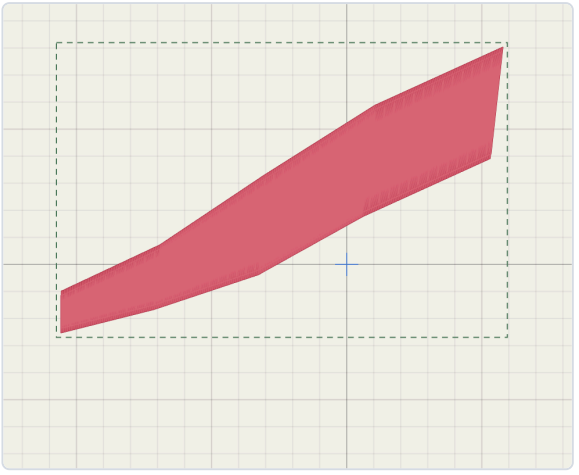

Satin line with a fixed width of 3 mm along a curved center line.

Satin A – free width (edges alternating)

Satin A

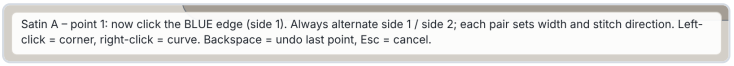

For satin with **varying thickness**: you click the two edges of the column alternately. Each pair of points defines width *and* stitch direction.

1. Choose the tool “Satin A”. The hint bar at the bottom explains every step.
2. Set **point 1** on the **blue** edge (side 1), **point 2** on the **orange** edge (side 2), point 3 blue again, point 4 orange …
3. Always click **alternately**: side 1, side 2, side 1, side 2. Each pair forms a “cross-section” of the column.
4. **Left click = corner**, **right click = curve**.
5. `Backspace` takes back the last point, `Esc` cancels, `Enter` ends.
6. Afterwards the edge points can be dragged with “Reshape”.

A column that gets wider from left (thin) to right (thick) – the width results from the click pairs.

> 💡 **Tip** More pairs = more exact shape. On curves rather click more often (every 5–10 mm).

The hint bar at the bottom of the work area tells you for every tool what to do next.

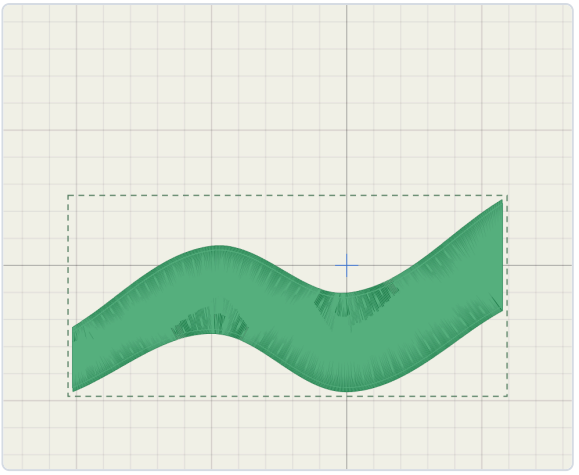

Satin B

Satin B – two edges one after the other

First draw **one edge** completely, then the **other**. The stitch direction turns with the shape automatically.

1. Choose the tool “Satin B”.
2. Draw the **first edge** from start to end (left click = corner, right click = curve), then `Enter`.
3. Draw the **second edge** in the same direction, end again with `Enter`.
4. The program lays the satin stitches between the two edges. The edges should be about the same length.

> 💡 **Tip** For changing widths with exact control satin A is more precise; satin B is faster for long, calm shapes.

Two curved edges make a column – the width follows the distance between the edges.

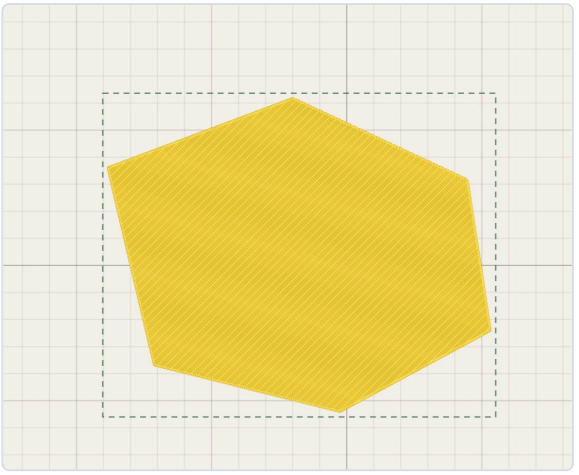

Fill

Fill (tatami)

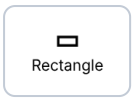

Fills a closed shape with rows of stitches – for large areas.

1. Choose the tool “Fill” and draw the **outline** (left click = corner, right click = curve).
2. `Enter` closes the shape.
3. Optionally draw **holes** (e.g. the inside of an “O”) and finish each with `Enter`. Pressing `Enter` once more without points skips the holes.
4. Finally set the **stitch angle** with two clicks (direction of the stitches) – or `Enter` for the default angle.
5. In the properties you can set the fill type (tatami, satin, contour, spiral, wave, pattern, gradient, cross stitch), density, stitch length, underlay and an outline.

> 💡 **Tip** Neighboring fills with different angles look livelier and stand out from each other.

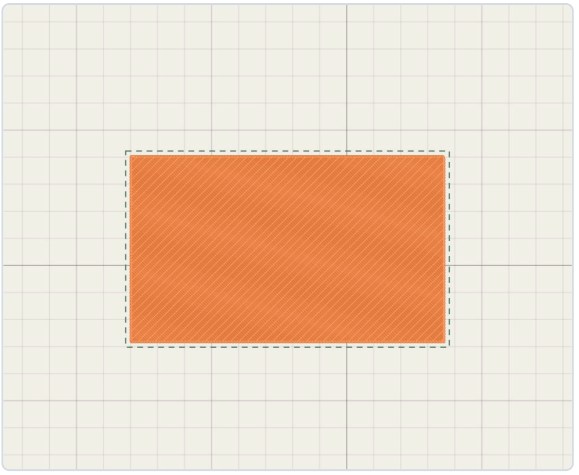

A hexagonal fill with a slanted stitch angle.

Rectangle

Draws a rectangle as a filled area – the fastest way to boxes, stripes and backgrounds.

1. Choose the tool, drag with the left mouse button held down from one corner to the opposite corner, release.
2. The rectangle is then an ordinary fill. With “Reshape” you can edit the corners further.

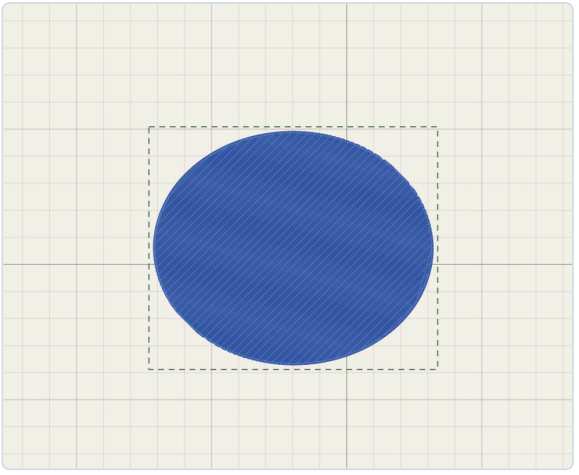

A drawn rectangle (filled orange).

Ellipse / circle

Draws an ellipse as a filled area. With the `Shift` key held down it becomes an exact circle.

1. Choose the tool, drag, release.
2. Holding `Shift` gives a circle.

A dragged ellipse in blue.

Text

A
Text

Puts lettering on the work area. You can choose ready-digitized **embroidery fonts** (cleanest results) or ordinary fonts, which are converted into embroidery objects automatically.

1. Choose the tool “Text” and click at the desired place. The text dialog opens.
2. Enter the wording, choose **font** and **height of the capital letters** in mm.
3. Optional: letter spacing, **arc radius** (text on a circular arc), **envelope shape** (bridge, wave, pennant …) and stitch type.
4. Click **Insert** – the text appears as a group of satin columns.
5. Later: click the text (double-click) to change it, “Adjust letters…” to move, rotate or enlarge single letters.

The text “Muster” in a script font.

💡 **Tip** Satin lettering below about 5 mm height becomes hard to read. With embroidery fonts the program suggests a good size.

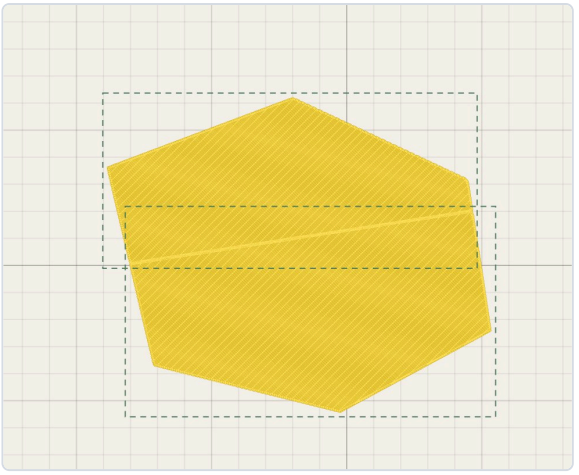

The text dialog.

Knife

Splits fills along a line into two parts – e.g. so that large fills fit into the hoop or are sewn at two angles.

1. Have the fill(s) ready and choose the tool “Knife”.
2. Draw a line across the fill: left click sets points, `Enter` cuts.
3. The fill then consists of two separate parts that can be edited individually (different angle, different color).

A fill was cut into two parts with the knife along a slanted line.

Manual – single stitches

Every click sets exactly **one stitch**. For very fine handwork and corrections.

1. Choose the tool, then set every needle penetration with a **left click**.
2. **Right click** sets a jump (needle lifts).
3. Objects of other kinds can be reworked stitch by stitch via “Edit → Convert to stitches”.

> 💡 **Tip** Use only for exceptions. The automatic density, pull compensation and underlay do not apply to manual stitches.

Curve (for touch)

For tablets without a right mouse button: when the button is on, every tap sets a **curve point** instead of a corner.

1. Switch the button on (it lights up).
2. Now every tap sets a curve point – like a right click.
3. Tap again to switch back.

---

6 Properties of the objects

When an object is selected, the **Properties** area on the right shows all settings. Usually you do not have to change anything: as long as **“Adapt to fabric (automatic)”** is switched on, the program calculates density, pull compensation, underlay and stitch lengths from fabric and width. Values you change by hand are kept; “Automatic again” resets them.

For all objects

Connection before	How the machine gets here from the previous object: automatic, always trim, jump without trim, or directly as a stitch.
Machine stops before	The machine stops before this object, e.g. so you can place appliqué fabric or puff foam.
Adapt to fabric	On: density, pull compensation, underlay etc. are calculated automatically from fabric and width (“auto”). Values you changed by hand are kept.
Back to automatic	Resets all values changed by hand to the automatic calculation for the selected fabric.

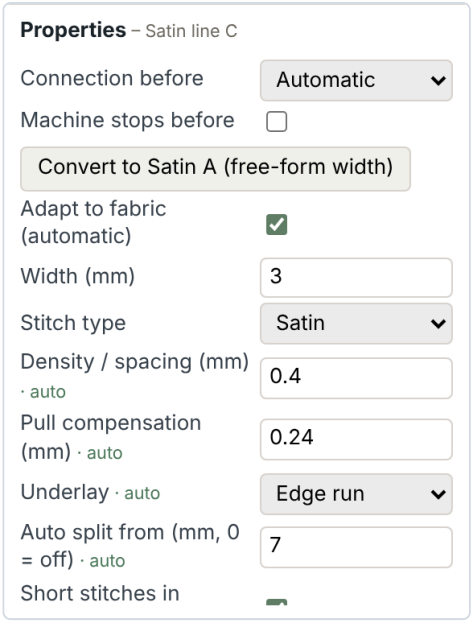

Running stitch and triple stitch

Stitch type	Run stitch = simple line. Triple stitch = every stitch three times (bolder). Bean stitch = forward-back-forward, looks hand-drawn.
Stitch length	Length of the individual stitches. Shorter follows curves more closely, longer looks smoother. Typical: 2–3 mm, 1.5 mm for tight curves.
Closed	Connects the end back to the start – for outlines around a shape.

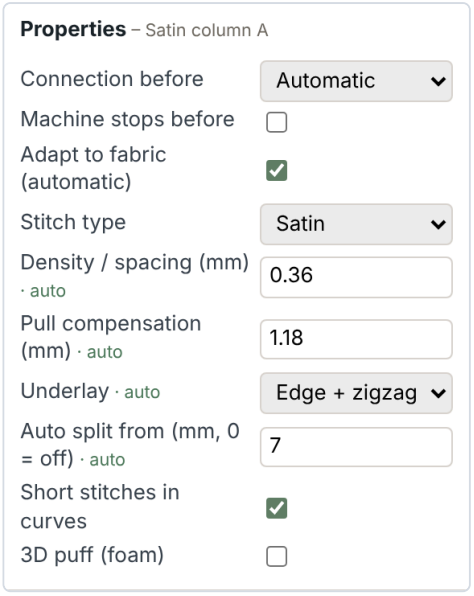

Satin (satin C, satin A, satin B)

Width	Width of the satin line in mm. About 1.5–8 mm stitches well; wider columns are split automatically.
Stitch type	Satin = stitches close together, shiny. E-stitch = edge with short cross stitches, typical for finishing appliqués.
Density (spacing)	Spacing between the satin stitches. Smaller = denser and better coverage, but stiffer. Typical: 0.35–0.45 mm.
Pull compensation	The thread pulls the fabric in, so satin comes out narrower than drawn. This value makes the column a little wider. Typical: 0.1–0.3 mm.
Underlay	Stitches under the satin that hold the fabric in place and lift the satin. Narrow: center run. Wide: edge run + zigzag.
Auto split	Satin stitches longer than this are split so they don’t snag. Typical: 7 mm. 0 = never split.
Short stitches in curves	On the inside of curves and corners every other stitch ends earlier – otherwise the needle points pile up into a lump there.
3D puff (foam)	For raised embroidery with foam: very dense, no underlay, reinforced ends, the machine stops so you can place the foam.

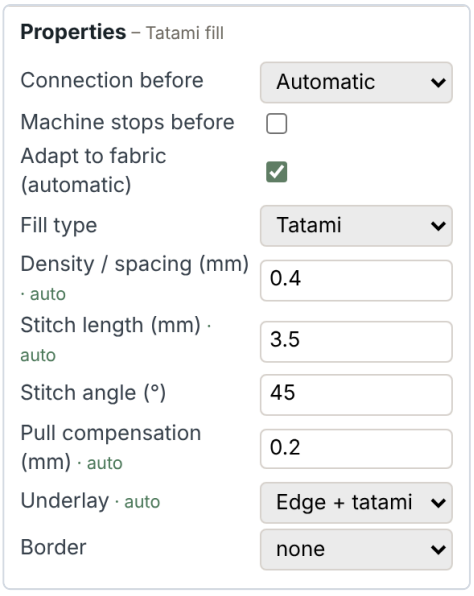

Satin line C

Satin column A

Fills

Fill type	Tatami = rows (default). Satin = shiny, small areas only. Contour/spiral = follows the edge. Wave, pattern, gradient, cross stitch = effects.
Density (row spacing)	Spacing between the stitch rows. Smaller = denser. Typical: 0.4 mm; thin fabrics rather 0.45, terry 0.35.
Stitch length	Length of the stitches in each row. Typical: 3–4 mm. Longer than 7 mm may snag.
Stitch angle	Direction of the stitch rows in degrees. Different angles on neighboring fills make them stand apart. Drag the orange handle with “Reshape”.
Pull compensation	Compensates for the fabric pulling in; the fill is extended slightly across the stitches. Typical: 0.2 mm.
Underlay	Stitches under the fill that stabilize the fabric. Edge run + tatami is right for most fabrics.
Border	Optional border around the fill: run stitch, triple stitch or satin. Covers the edge cleanly.
Satin border width	Width of the satin border around the fill.
Pattern	The pattern formed by the offset needle points in the fill: diamonds, diagonals, bricks or waves.
Wave height	How strongly the rows swing up and down. Typical: 1–3 mm.
Wavelength	Distance from crest to crest. Larger = calmer, flatter waves.
Gradient to spacing	The fill starts dense and gets more and more open towards the other side, up to this row spacing. Saves stitches and looks like a color gradient.
Cross size	Size of one cross-stitch cell. Typical: 2–3 mm.
Double crosses	Each leg of the cross is stitched twice – bolder and better coverage.

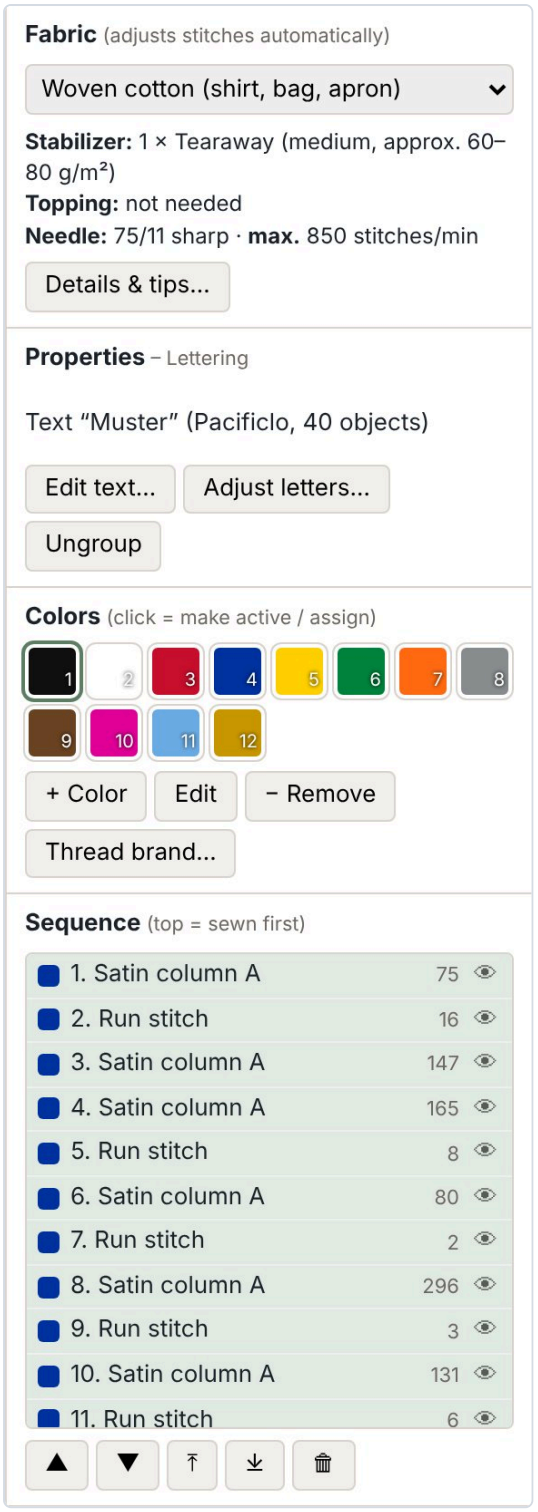

Tatami fill

Satin split	Only for satin fills: stitches longer than this are split.

Text

Edit text	Opens the text dialog: change wording, font, size, arc and envelope. The text is rebuilt.
Adjust letters	Move, rotate or enlarge individual letters and set the spacing between letters (kerning) by hand.
Ungroup	Makes every letter a separate object. After that the text can no longer be edited as text.

The right side with text selected: edit text, adjust letters, ungroup.

> 📌 **Note Rules of thumb:** satin 0.35–0.45 mm density · tatami row spacing 0.4 mm · stitch length in fills 3–4 mm · satin width 1.5–8 mm · pull compensation 0.1–0.3 mm. The automation usually gets this right.

7 Fabric, colors, order, hoop and simulation

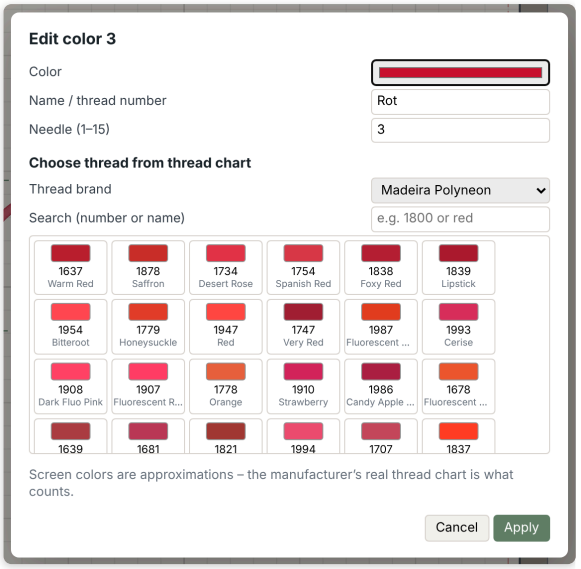

Fabric

The fabric you are embroidering on. Density, stitch length, pull compensation and underlay adjust automatically, and you get a stabilizer recommendation. The button **Details & tips…** shows all recommendations (stabilizer, topper, needle, speed). For fabrics with pile (terry, fleece, knit, piqué) the program offers a **knockdown stitch**.

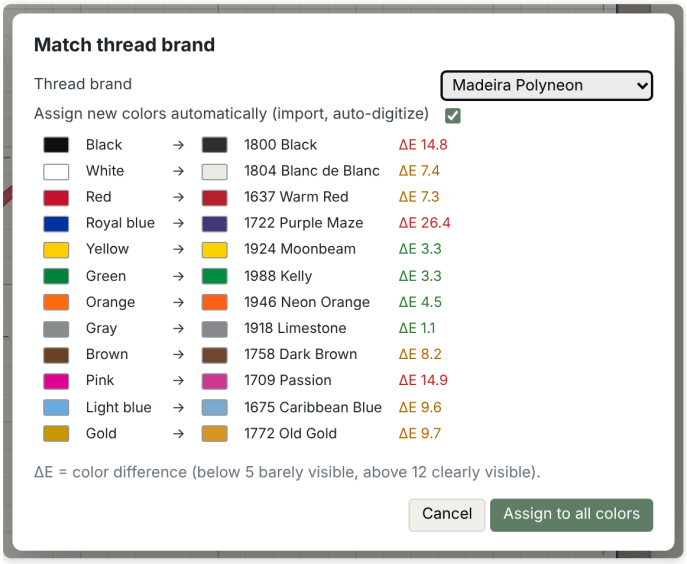

Colors and threads

Click a color = active color for new objects; if something is selected, it gets this color. The number is the needle number.

- **+ Color** adds a color, **Edit** opens the color dialog, **− Remove** deletes an unused color.
- In the color dialog you choose the **real thread** from a color chart (e.g. Madeira, Isacord), assign a name and **needle number**.
- **Thread brand…** assigns the most similar thread of a brand to all colors at once.

Color dialog with thread chart.

Assign thread brand: the table shows beforehand how well each thread matches.

Order

All objects in the order they are stitched (top first). Click to select, the eye hides an object.

- Arrow ▲▼: sew one place earlier / later.
- ⤒ ⤓: very first / very last.
- The eye hides an object (it is then not sewn).

> 💡 **Tip** Rule of thumb: **fills first, details on top**. What is sewn last lies on top. With “Edit → Sort by color” and “Optimize sequence” you avoid color changes and long jumps.

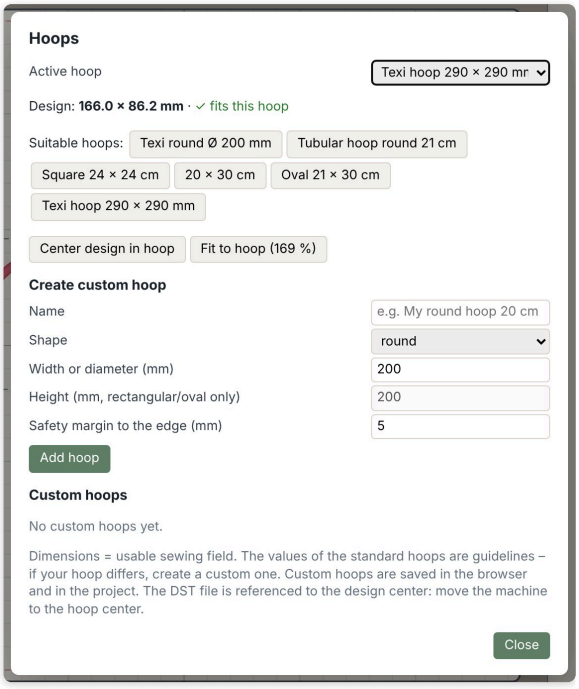

The order list.

Embroidery hoop

Which hoop is used. The sewing field is displayed and the program warns you if the design doesn’t fit.

Create your own hoops (rectangular, round, oval), find hoops that fit and fit the design to them. Enter the dimensions of the **inner space** (not the outer edge). The safety margin keeps the presser foot away from the hoop edge.

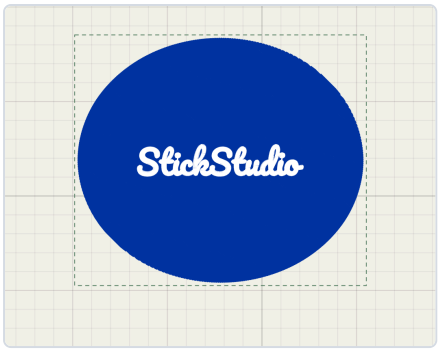

The hoop dialog.

Stitch simulation and view

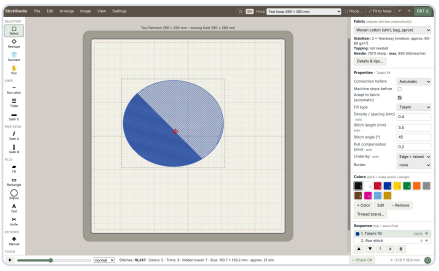

Plays back the order in which the machine stitches. If something is selected, only the selection plays (the rest is faded) – otherwise the whole design. Drag to show the design up to a certain stitch – handy for checking the sequence step by step.

TrueView (T): glossy thread

Needle penetration points

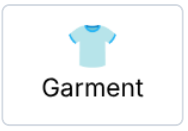

Simulation up to halfway

8 Garment templates: setting the embroidery position exactly

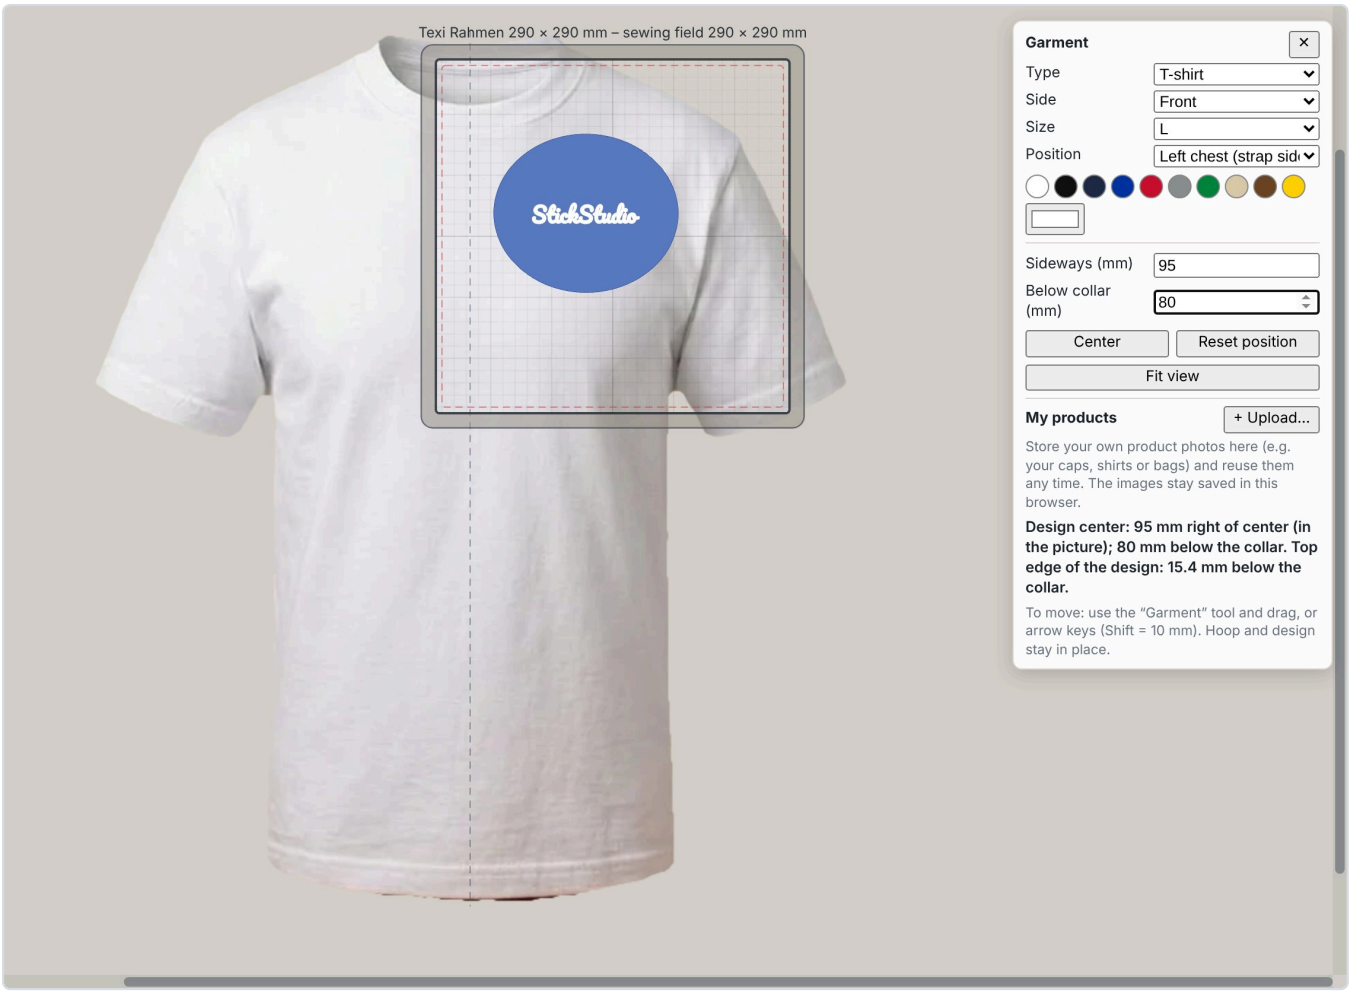

With the **garment template** you place a garment behind the embroidery hoop. You see immediately where the embroidery will sit later and can set the position exactly in millimeters – on the T-shirt, the hoodie or the cap.

Switching on

1. Click the tool **Garment** on the left – or use the menu **File → Garment template behind the hoop…**.
2. The **Garment** window appears on the right, and a T-shirt lies behind the embroidery hoop.
3. The hoop becomes semi-transparent and the sewing field stays clear: you see design and fabric together.
4. With the ✕ at the top of the window you switch the garment off again.

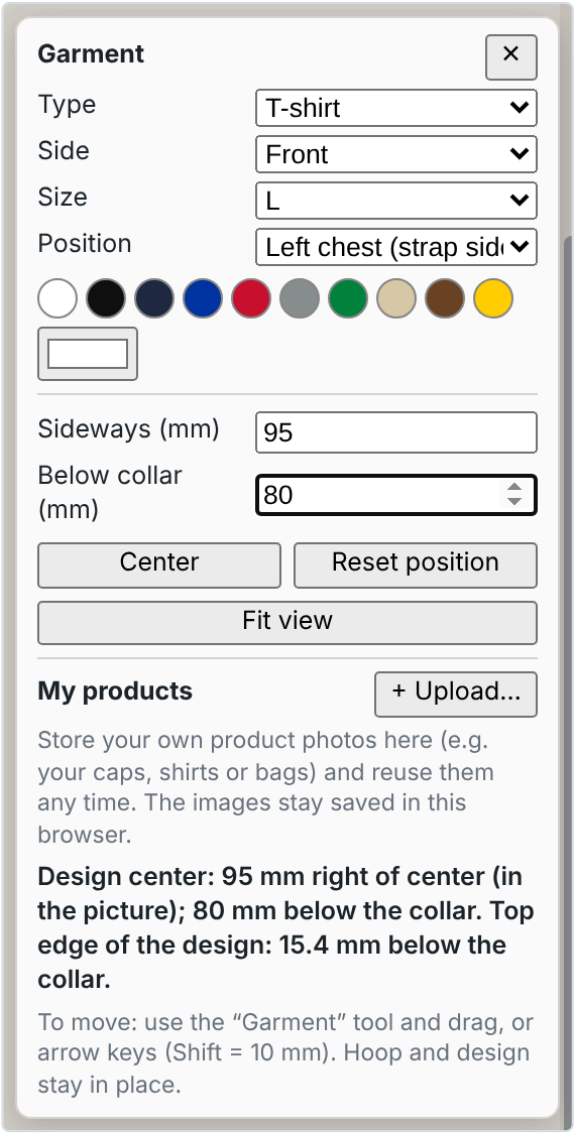

The tool “Garment”.

The design (blue area) sits on the left chest. On the right the Garment window; the dashed vertical line is the center line of the shirt.

Choosing the garment

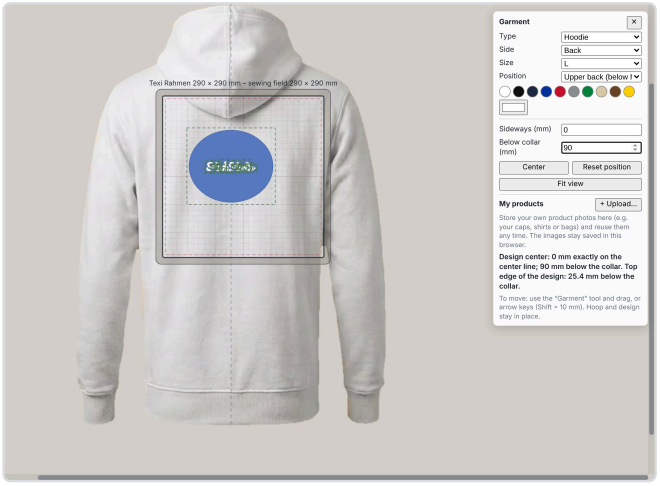

Type	T-shirt, polo, sweatshirt, hoodie, softshell jacket or cap.
Side	Front, back, left side, right side (the cap is also available from the back).
Size	S to XXL – the garment is shown correspondingly larger or smaller. For the cap there is no size choice.
Position	Usual placement, e.g. left chest, chest center, upper back, sleeve or cap front center. When you choose it, the garment jumps under the hoop so that the hoop center lies on this spot.
Color	Ten standard colors or a custom color. Light and shadow of the fabric are kept.

The “Garment” window.

Dark blue T-shirt: the color can be changed at any time.

Hoodie from the back, design below the hood.

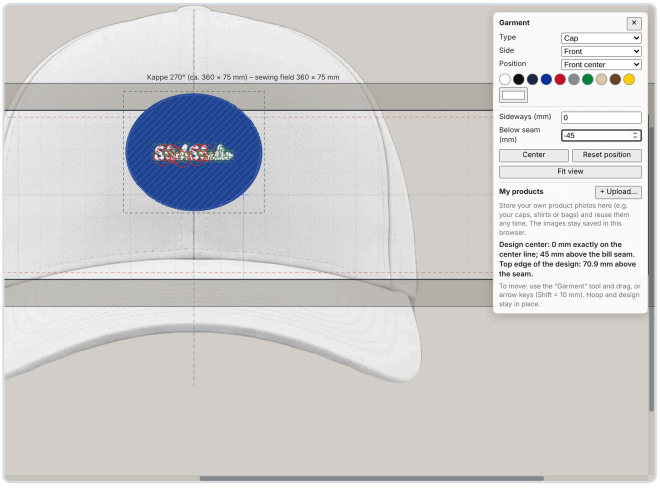

Positioning exactly

1. **Dragging:** tool “Garment”, hold the mouse button and drag. The garment moves, hoop and design stay put.
2. **Arrow keys:** 1 mm per key press, with `Shift` 10 mm.
3. **Typing:** in the window enter the desired values for **Sideways (mm)** and **Below collar (mm)**. Positive values mean right of the center (in the picture) or below the collar.
4. **Center** puts the design exactly on the center line. **Reset position** restores the chosen default position.
5. **Fit view** shows the whole garment.

> 📌 **Note** Below the input fields it says in words where the design sits, e.g. “Design center: 95 mm right of center; 80 mm below the collar. Top edge of the design: 15 mm below the collar.” You can pass these dimensions directly to the customer or the seamstress.

Common dimensions

- **Left chest:** design width 70–100 mm, center about 90–100 mm beside the center line and 70–100 mm below the collar.
- **Chest center:** up to about 250 mm wide, top edge 70–100 mm below the collar.
- **Upper back:** 60–90 mm below the collar (nape).
- **Cap front:** up to about 110 × 55 mm.

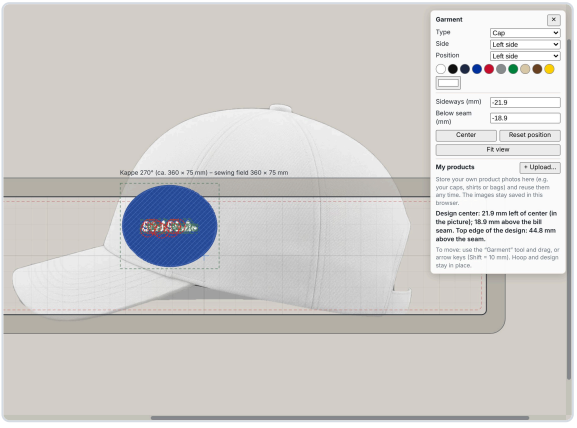

Cap from the front with cap hoop.

Caps

For caps it is best to choose the **cap hoop** at the top (e.g. “Cap 270°”). The cap is available from the **front**, the **back** and from the **left** and **right**. The **bill seam** serves as reference: the display then says “… mm above the bill seam”.

The side view shows how far the design reaches around the side of the cap – important so that nothing runs into the seam or the bill.

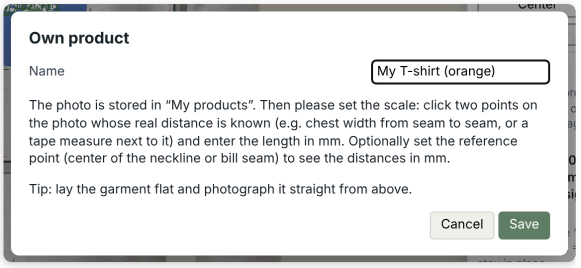

Cap from the side (bill on the left).

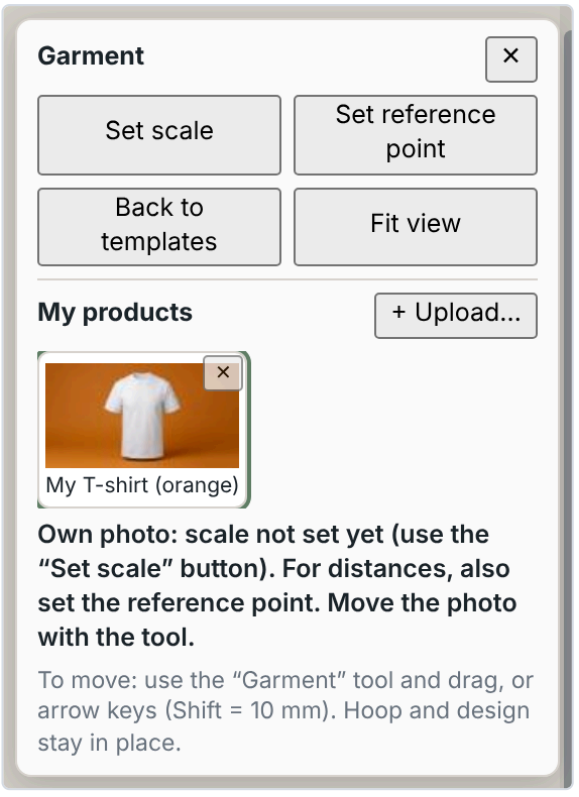

Uploading your own products (“My products”)

Do you have a piece of your own (a polo from your supplier, a particular cap, a bag)? Then store a **photo** of it and use it like the built-in templates. The photo stays saved in the browser and is ready at every start.

1. In the window under **My products** click **+ Upload…** and choose a photo (JPG or PNG).
2. Enter a **name** and **Save**. The photo now lies behind the hoop.
3. **Set scale:** click two points on the photo whose real distance you know (e.g. the chest width from seam to seam), then enter the length in mm. From now on the millimeters are correct.
4. **Set reference point** (optional): click the center of the neckline or the bill seam. The window then shows the distances “sideways” and “below the reference point” again.
5. Move the photo like the garment templates: drag or arrow keys. With **Back to templates** you switch back to T-shirt & co.

Name for the new product.

The product appears under “My products”.

Set scale: after two clicks on known points you enter the real length.

💡 **Tip How to get a good photo:** lay the piece flat and photograph it straight from above, preferably on a plain, light background. Do not cut anything off at the edge. A tape measure next to it helps with the scale.

⚠ **Caution** The photos are stored only in the browser in which you uploaded them. On another computer or browser you have to upload them again. With ✕ on the thumbnail you delete a product.

Preview, worksheet and project

- **File → Product preview** shows garment and embroidery to scale in one picture – to save or for the conversation with the customer.
- **Print worksheet** additionally contains the picture “Position on the garment”.
- The setting (type, side, size, color, position and an own photo) is saved with the project.

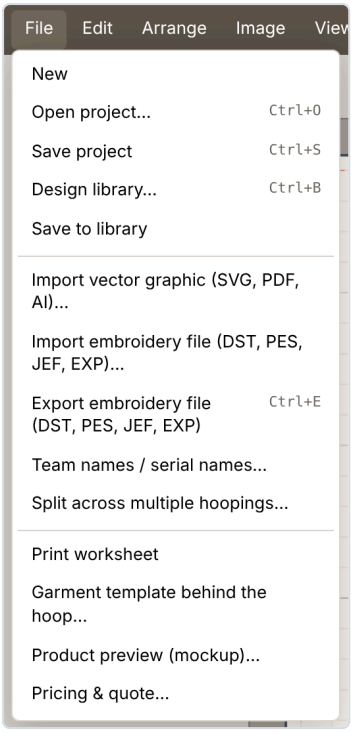

The product preview on the garment.

📌 **Note** The dimensions of the garment templates are **guide values** for size L and can differ somewhat depending on the manufacturer. For an exact measurement take a photo of your real piece and set the scale yourself.

9 The menus

All commands of the menu bar with explanations. Dialogs are shown with a picture.

Menu “File”

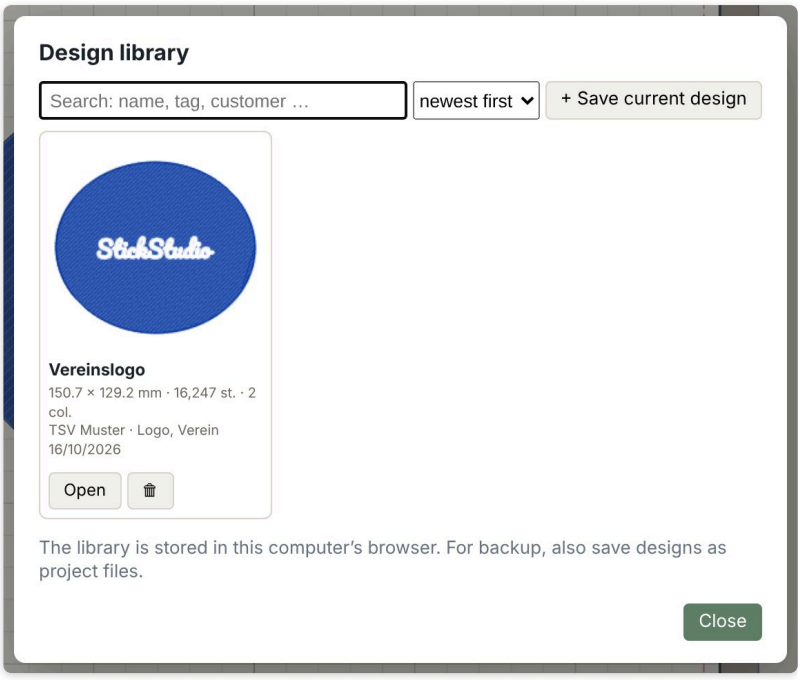

New	Starts a blank design. The current design is discarded – save it first if you still need it.
Open project	Loads a saved StickStudio project (.stick.json) with all objects, colors and settings – fully editable.
Save project	Saves the design as an editable project file. The machine, however, needs an embroidery file (see “Export embroidery file”).
Design library	All designs stored in the library, with thumbnails. Search by name, customer or keyword and open with one click.
Save to library	Stores the current design in the library with thumbnail, keywords and customer (in this computer’s browser).
Import vector graphic	Loads a logo as SVG, PDF or AI and automatically converts the shapes into embroidery objects. Best quality for logos.
Import embroidery file	Opens an existing embroidery file (DST, PES, JEF, EXP). You can view the stitches, move them and edit them one by one.
Export embroidery file	Creates the file for the embroidery machine. For the Texi 1501 choose “DST”, copy it to a USB stick and load it on the machine.
Team names	One design, many names: use a text as placeholder and enter a list of names – each name gets its own embroidery file (all in one ZIP).
Multi-hooping	For designs larger than the hoop: splits the design into several files with registration marks for exact alignment.
Print worksheet	Prints a production worksheet: preview, color sequence with needle numbers, stitch count, size, stabilizer recommendation and stops.
Garment template	Places a T-shirt, polo, sweatshirt, hoodie, softshell jacket or cap (front, back, sides) behind the hoop. Move the garment under the hoop: the distances from the center line and collar are shown in mm. Also works with your own product photos.

Product mockup	Shows the design to scale on the garment (when the garment template is on) or on a T-shirt, polo, hoodie, cap, towel or bag – good for showing it to the customer.
Price calculator	Calculates the price per piece by stitch count or machine time, with quantity discounts, and prints a quote.

Design library

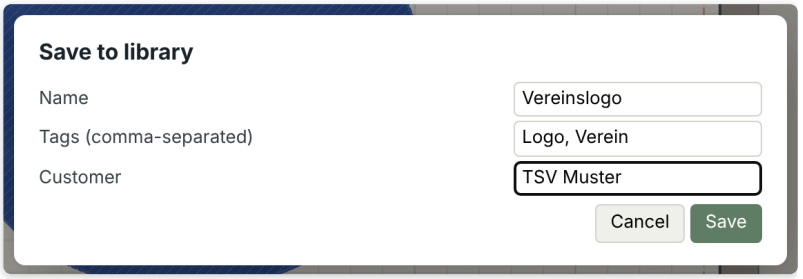

All designs stored in the library, with thumbnails. Search by name, customer or keyword and open with one click.

Design library with one saved design

Save to library

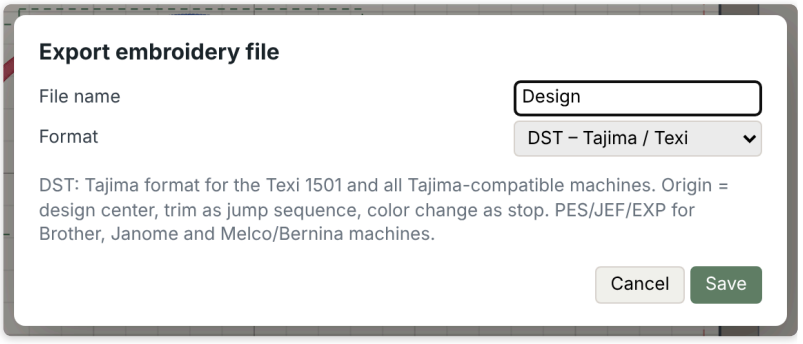

Stores the current design in the library with thumbnail, keywords and customer (in this computer's browser).

Export embroidery file

Creates the file for the embroidery machine. For the Texi 1501 choose "DST", copy it to a USB stick and load it on the machine.

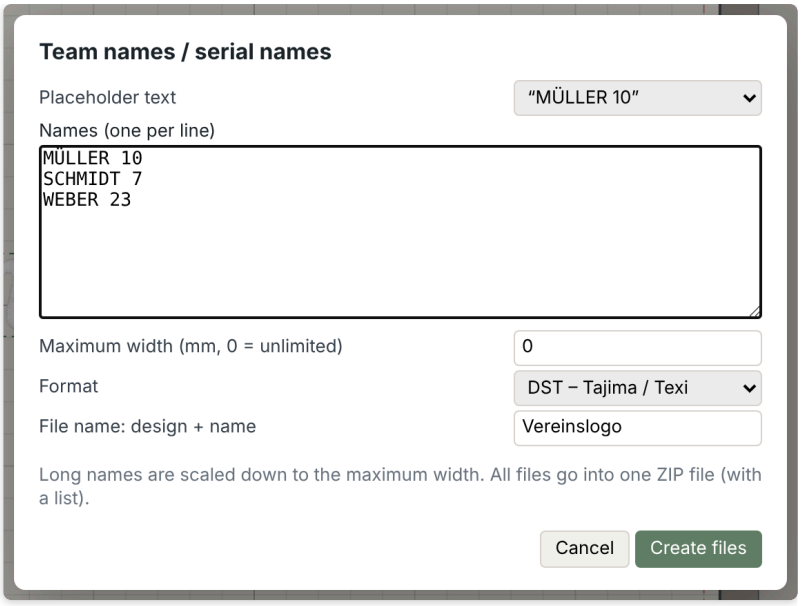

Choose the format for your machine: **DST** for the Texi 1501 and all Tajima-compatible industrial machines, **PES** for Brother, **JEF** for Janome, **EXP** for Melco/Bernina. Then copy the file to a USB stick and load it on the machine.

Team names

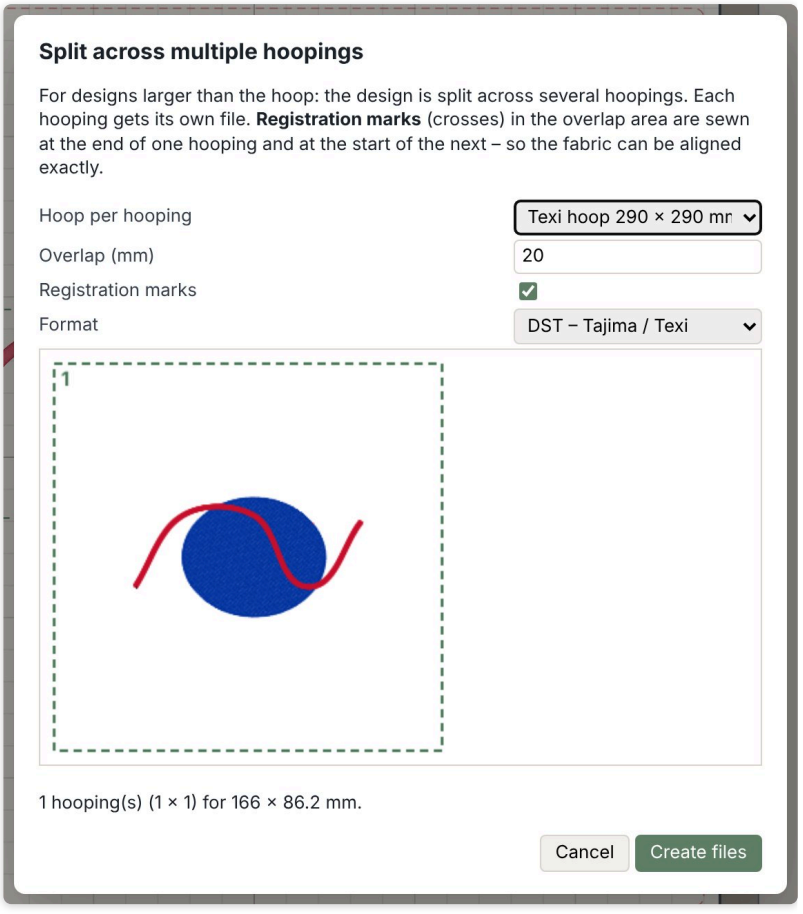

One design, many names: use a text as placeholder and enter a list of names – each name gets its own embroidery file (all in one ZIP).

First create a text with a placeholder name (e.g. “MUELLER 10”). In the dialog you enter the list of names – one line per person. The program creates a separate embroidery file for each name and packs them all into one ZIP file.

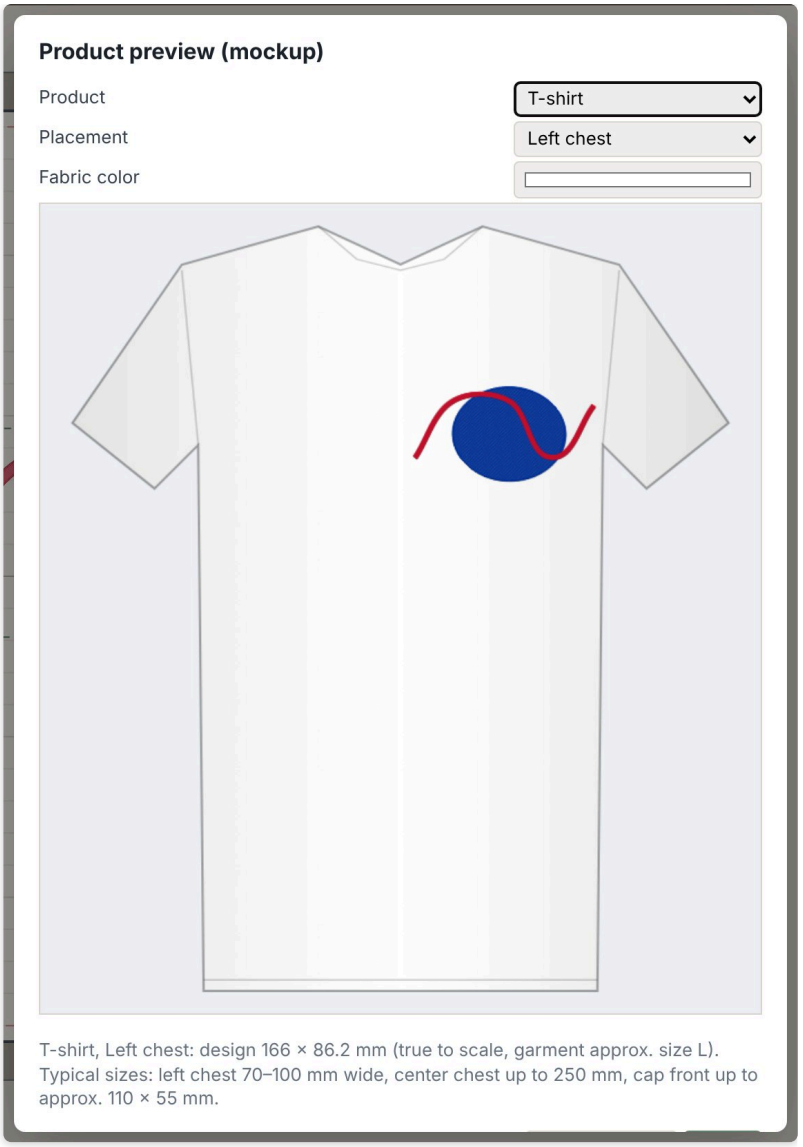

Multi-hooping

For designs larger than the hoop: splits the design into several files with registration marks for exact alignment.

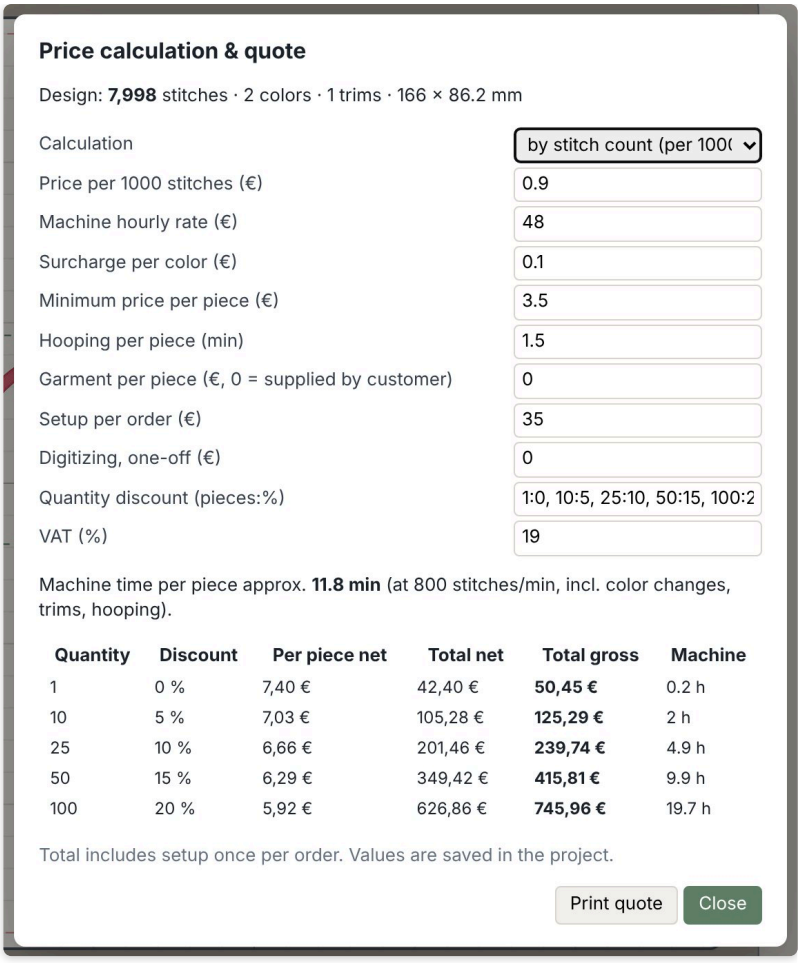

Product mockup

Shows the design to scale on the garment (when the garment template is on) or on a T-shirt, polo, hoodie, cap, towel or bag – good for showing it to the customer.

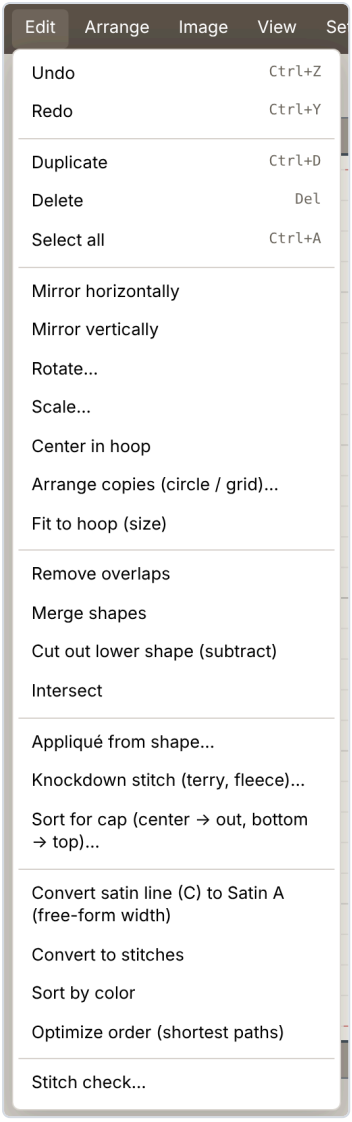

Price calculator

Calculates the price per piece by stitch count or machine time, with quantity discounts, and prints a quote.

Menu “Edit”

Undo (Ctrl+Z)	Undoes the last step. Press repeatedly to go further back.
Redo (Ctrl+Y)	Restores a step that was undone.
Duplicate (Ctrl+D)	Copies the selected objects. The copy is placed slightly offset next to them.
Delete (Del)	Removes the selected objects from the design.
Select all (Ctrl+A)	Selects all objects, e.g. to move or scale the whole design.
Mirror horizontally	Mirrors the selection left ↔ right. Stitch angles are mirrored too.
Mirror vertically	Mirrors the selection top ↔ bottom.
Rotate	Rotates the selection by any angle you like. The stitches are recalculated.
Scale	Changes the size in percent. The stitches are recalculated so the density stays right (not simply “blown up”).
Center in hoop	Moves the selection (or the whole design) to the exact center of the hoop.
Arrange copies	Repeats the selection in a circle (e.g. petals, stars all around) or as a grid in rows and columns.
Fit to hoop	Enlarges or reduces the design (or the selection) so it fits exactly into the sewing field. Stitches are recalculated.
Remove overlaps	Cuts out hidden parts underneath objects on top. Saves stitches and prevents hard, thick spots.
Merge shapes	Merges the selected fills into a single shape.
Cut from bottom shape	Subtracts the upper selected shapes from the bottom one – like a cookie cutter.
Intersect	Keeps only the area where all selected shapes overlap.
Appliqué from shape	Turns a shape into an appliqué: placement line, stop, tack-down, stop, satin cover. Saves lots of stitches on large areas.
Knockdown stitch	Places a loose grid under the design that flattens pile or loops (terry, fleece, knits) so details don’t sink in.

Sequence for cap	Sequences for caps: from the center outwards and from bottom to top. Prevents distortion and puckering on the cap.
Convert to Satin A	Turns a fixed-width satin line (Satin C) into a column with two separate edges. Then use “Reshape” to drag the edge points and change the width in places.
Convert to stitches	Turns the object into individual stitches you can move freely. After that, density etc. can no longer be changed automatically.
Sort by color	Orders the objects by color so the machine needs fewer color changes.
Optimize sequence	Orders the objects within each color so the paths between them are as short as possible – fewer jumps and trims.
Stitch check	Checks the design for problems such as too dense, too narrow, stitches too long or bad angles, and suggests fixes.

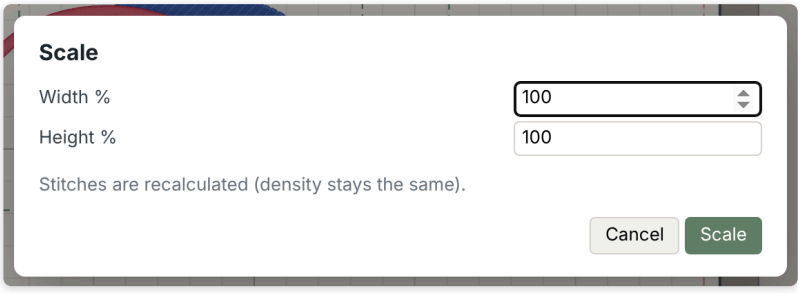

Rotate

Rotates the selection by any angle you like. The stitches are recalculated.

Scale

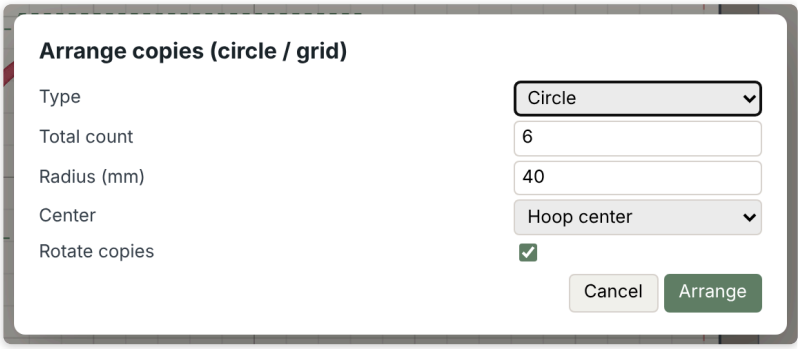

Changes the size in percent. The stitches are recalculated so the density stays right (not simply “blown up”).

Arrange copies

Repeats the selection in a circle (e.g. petals, stars all around) or as a grid in rows and columns.

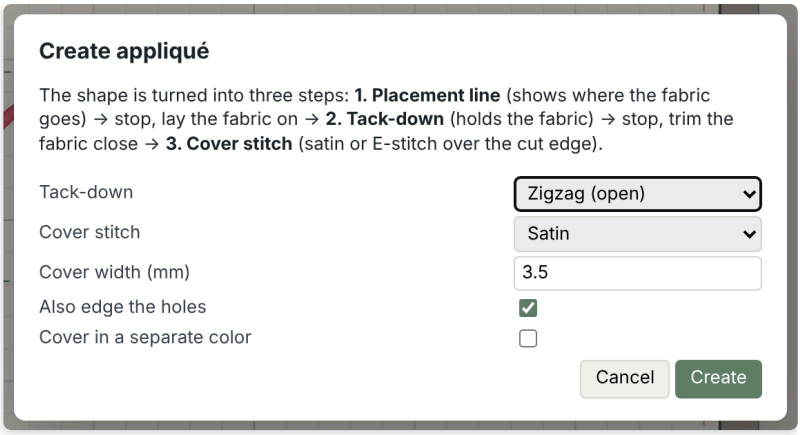

Duplicates the selection in a circle (e.g. petals) or as a grid. For the circle the original counts.

Appliqué from shape

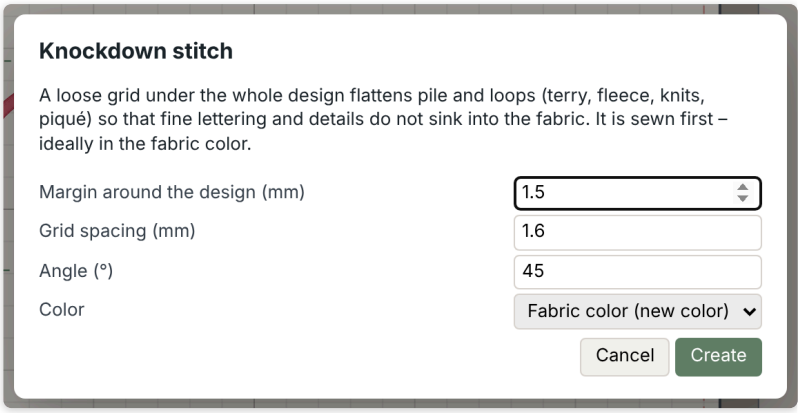

Turns a shape into an appliqué: placement line, stop, tack-down, stop, satin cover. Saves lots of stitches on large areas.

A shape becomes an appliqué: first the placement line (shows where the fabric goes), then stop, tack-down stitch, stop for trimming and finally the satin cover.

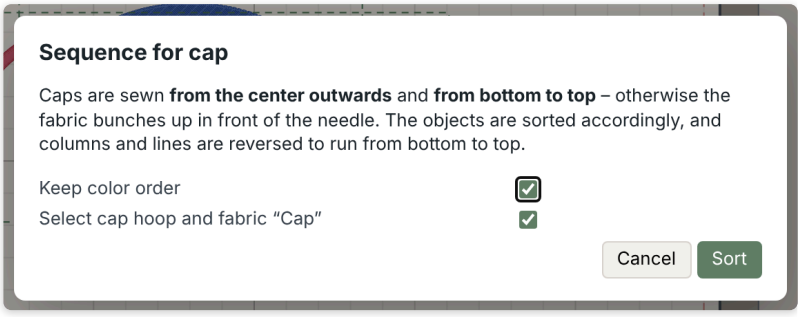

Knockdown stitch

Places a loose grid under the design that flattens pile or loops (terry, fleece, knits) so details don’t sink in.

Sequence for cap

Sequences for caps: from the center outwards and from bottom to top. Prevents distortion and puckering on the cap.

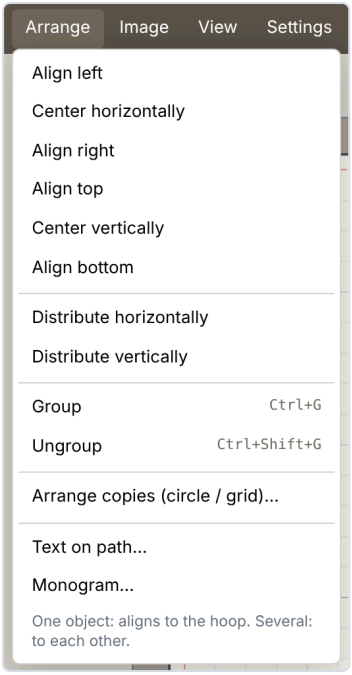

Stitch check

Checks the design for problems such as too dense, too narrow, stitches too long or bad angles, and suggests fixes.

Menu “Arrange”

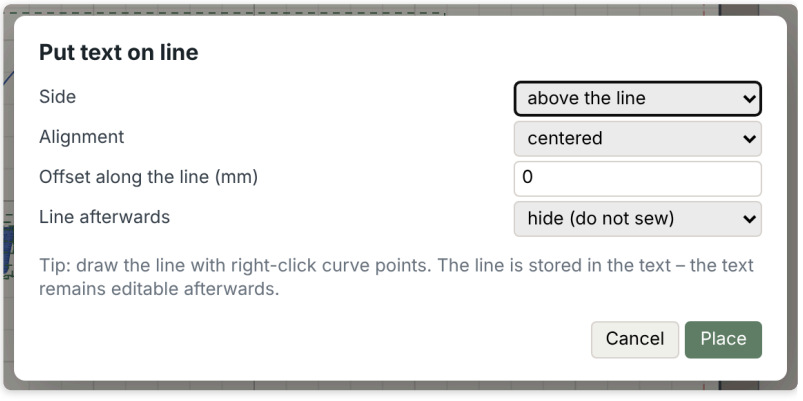

Align left	One object: to the left edge of the sewing field. Several: all to the left edge of the selection.
Center horizontally	Aligns the objects on a common vertical center line (one object: hoop center).
Align right	One object: to the right edge of the sewing field. Several: to the right edge of the selection.
Align top	Aligns the top edges with each other (one object: top edge of the sewing field).
Center vertically	Aligns the objects on a common horizontal center line.
Align bottom	Aligns the bottom edges with each other (one object: bottom edge of the sewing field).
Distribute horizontally	Spreads three or more objects so the gaps between them are equal from left to right.
Distribute vertically	Spreads three or more objects with equal gaps from top to bottom.
Group (Ctrl+G)	Combines the selection: afterwards one click selects all parts and they move together.
Ungroup	Edit the parts of a group individually again. Text can no longer be edited as text afterwards.
Arrange copies	Repeats the selection in a circle (e.g. petals, stars all around) or as a grid in rows and columns.
Put text on line	Lays a text along a drawn line, e.g. an arc or circle. Select the text and the line together.
Monogram	Creates initials from templates: large center letter, in a circle, in a diamond or with lines.

Put text on line

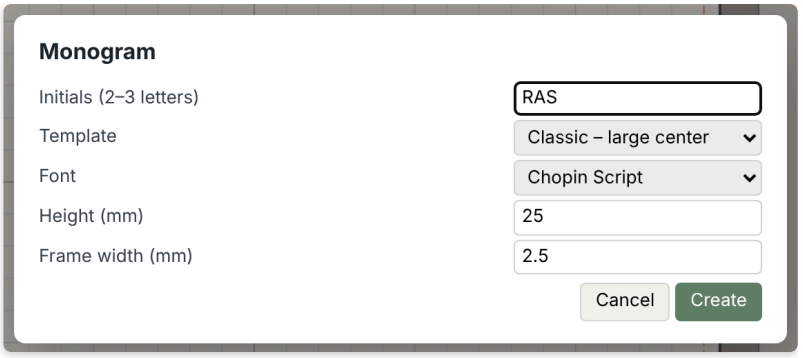

Lays a text along a drawn line, e.g. an arc or circle. Select the text and the line together.

First draw a line (e.g. an arc), place the text, select both and call the command. The text lays itself on the line.

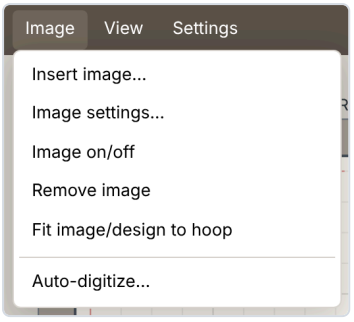

Monogram

Creates initials from templates: large center letter, in a circle, in a diamond or with lines.

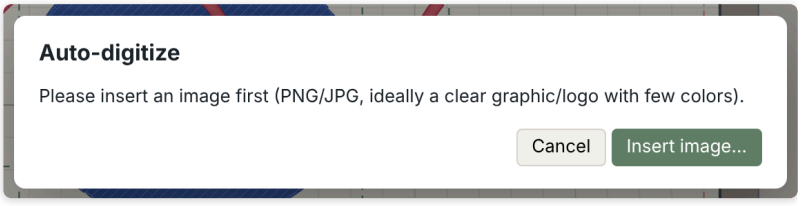

Menu “Image”

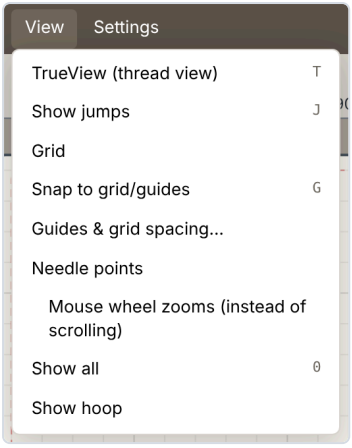

Insert image	Loads a photo or logo (JPG, PNG) as a backdrop – for tracing by hand or auto-digitizing.
Image settings	Change the size, position and opacity of the backdrop image.
Image on/off	Hides or shows the backdrop image. It is never stitched.
Remove image	Deletes the backdrop image.
Fit to hoop	Enlarges or reduces the design (or the selection) so it fits exactly into the sewing field. Stitches are recalculated.
Auto-digitize	Automatically converts the backdrop image into embroidery objects (satin for narrow parts, tatami for areas). Everything can be edited afterwards.

Auto-digitize

Automatically converts the backdrop image into embroidery objects (satin for narrow parts, tatami for areas). Everything can be edited afterwards.

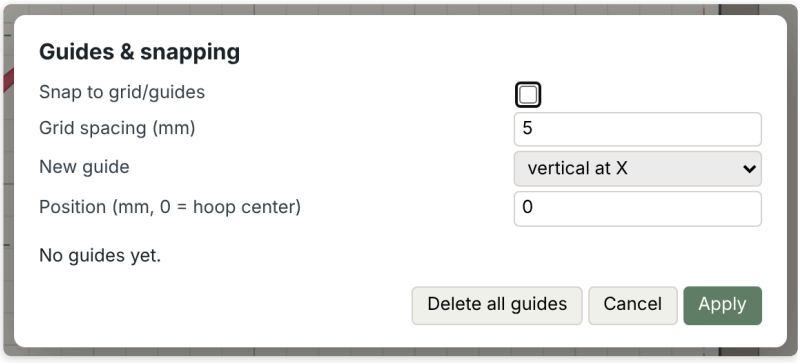

Menu “View”

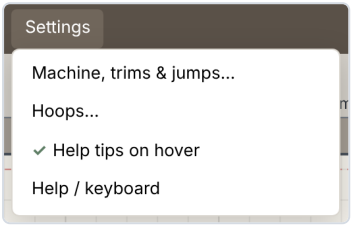

TrueView / thread view (T)	Shows the stitches like real thread with sheen – or as thin lines so you can see every needle point.
Show jumps (J)	Shows the paths where the machine jumps without stitching as dashed lines.
Grid	Shows or hides the millimeter grid.
Snap (G)	Points and moved objects snap to the grid and guides – for perfectly straight, equally sized shapes.
Guides & grid spacing	Add your own horizontal or vertical guides and change the grid spacing used for snapping.
Needle points	Shows every single needle penetration as a dot – helpful for spotting areas that are too dense.
Mouse wheel zooms	Off (default): wheel = up/down, Shift + wheel = left/right, Ctrl + wheel = zoom. On: the wheel zooms as before. You can always pan with Space + drag too.
Show all (0)	Zooms so the whole design is visible. To pan: mouse wheel (up/down), Shift + wheel (left/right), Space + drag or the arrow keys.
Show hoop	Zooms so the whole hoop is visible.

Guides & grid spacing

Add your own horizontal or vertical guides and change the grid spacing used for snapping.

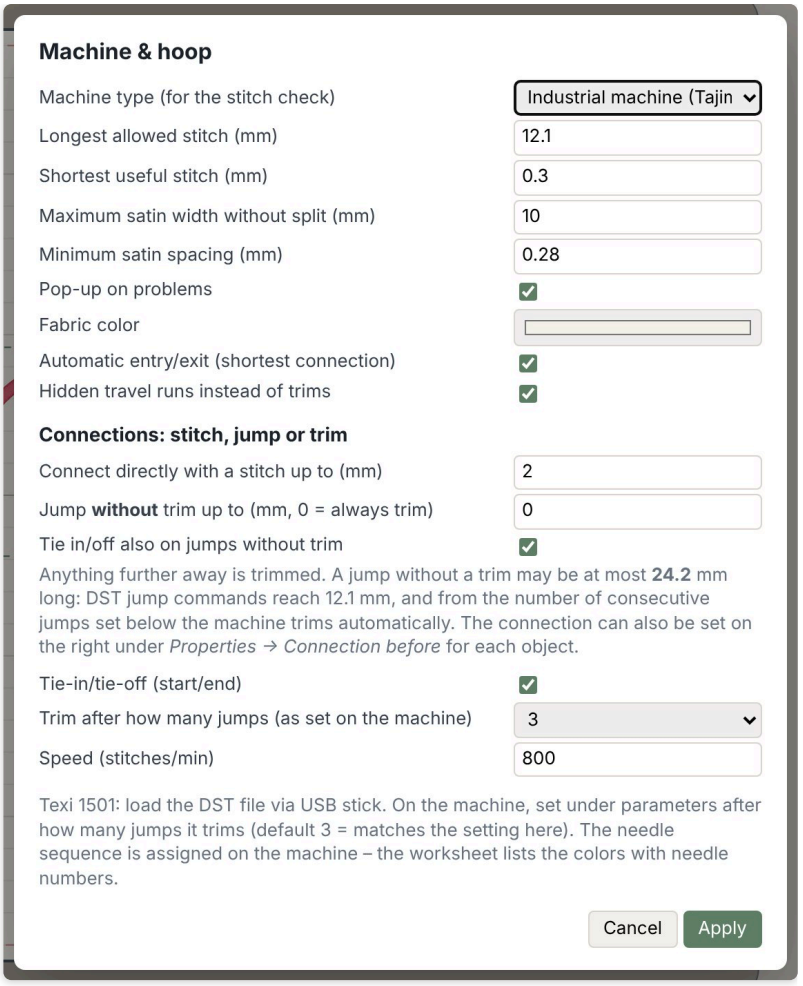

Menu “Settings”

Machine, trims & jumps	Machine type, speed, when to trim instead of jump, hidden travel runs and stitch check limits.
Hoops	Choose a hoop or create your own (rectangular, round, oval). The sewing field is shown on the canvas.
Help tips on hover	Turns these info boxes on or off. The setting is remembered.
Help / keyboard	Overview of mouse and keyboard commands.

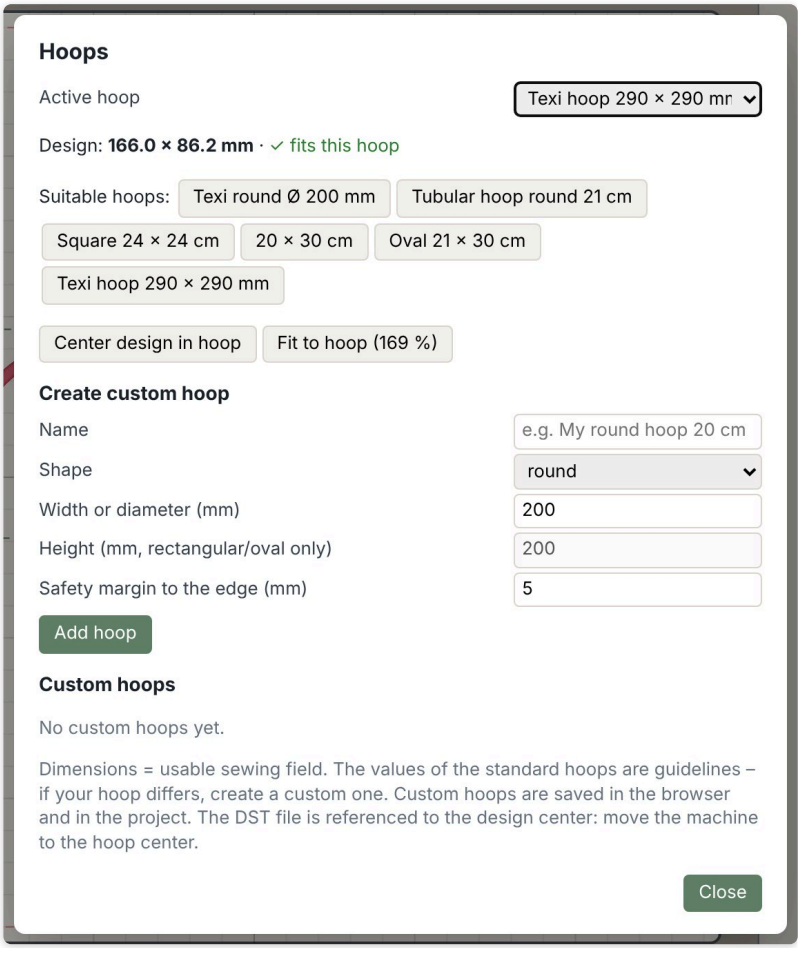

Machine, trims & jumps

Machine type, speed, when to trim instead of jump, hidden travel runs and stitch check limits.

Hoops

Choose a hoop or create your own (rectangular, round, oval). The sewing field is shown on the canvas.

10 Recipes: typical tasks

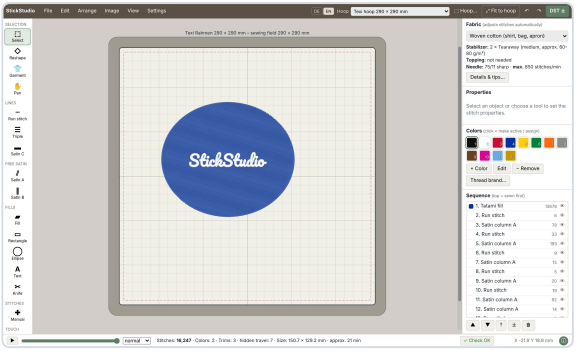

Typical tasks as step-by-step recipes.

Club patch: fill with lettering

A filled shape with white text – the basis of many logos and badges.

1. Choose the color blue, tool **Ellipse**, drag it open.
2. Choose the color white, tool **Text**, click in the middle.
3. Enter text, choose font and height, **Insert**.
4. Select everything (`Ctrl` + `A`) and align with **Arrange → Center horizontally**.
5. Look at the check and export.

> 💡 **Tip** White thread on blue: the text is sewn last and lies on top of the fill.

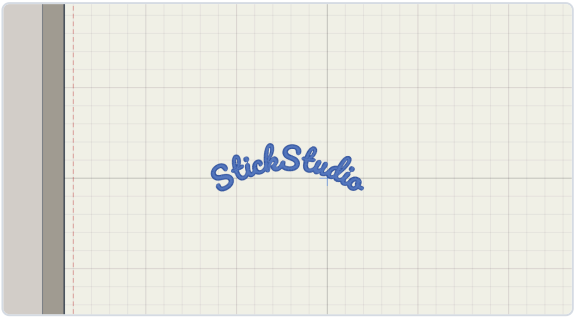

Blue ellipse with white lettering.

Lettering on an arc

Text on a circular arc – typical for club logos and badges.

1. Tool **Text**, click, enter text.
2. In the dialog under **Arc radius** enter e.g. 60. 0 = straight, **negative** = arc downwards (text at the bottom of the circle).
3. **Insert** – the text lies on the arc. You can improve it any time with “Edit text…”.

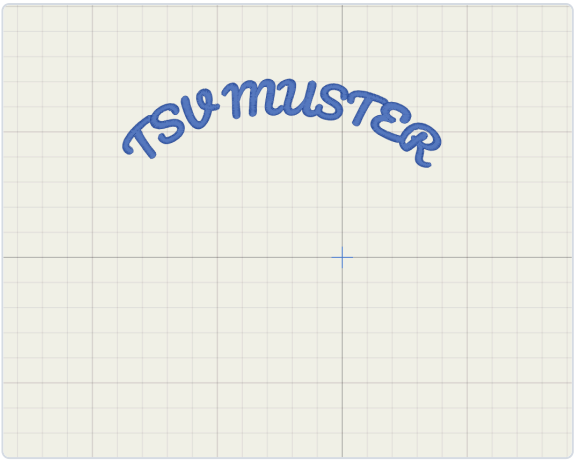

Text with arc radius 60 mm.

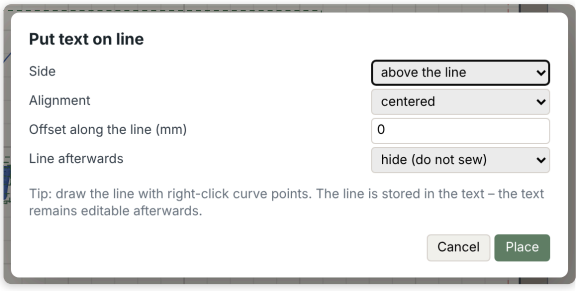

Text on a freely drawn line

When the text should follow a shape of your own (wave, circle, crest).

1. First draw the line as a **running stitch** (right click for curve points).
2. Place the text with the text tool.
3. Select text and line together (drag a frame).
4. **Arrange → Text on path…** – choose side (above/below), alignment and offset; the line can be hidden afterwards.

Text following an arc.

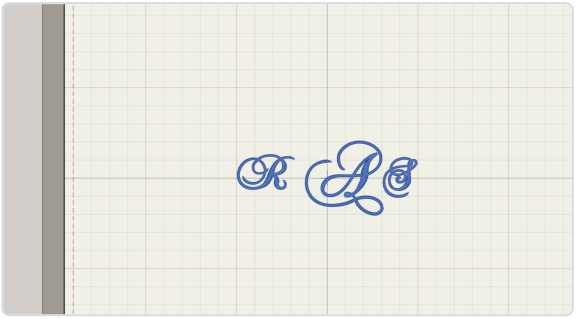

Monogram

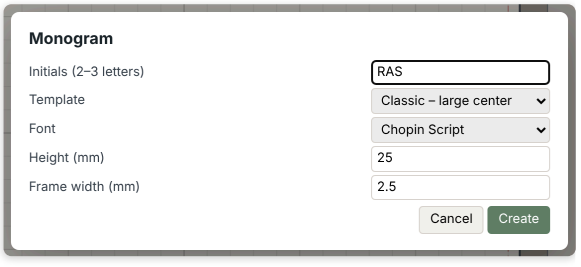

Two to three initials, classically with a large middle letter, in a circle, in a diamond or with lines.

1. **Arrange → Monogram…**.
2. Enter initials (e.g. “RAS”), choose template and font, set the height in mm.
3. **Create** – the monogram lies in the middle as a group.

> 💡 **Tip** Towels and shirts: 20–40 mm letter height is usual.

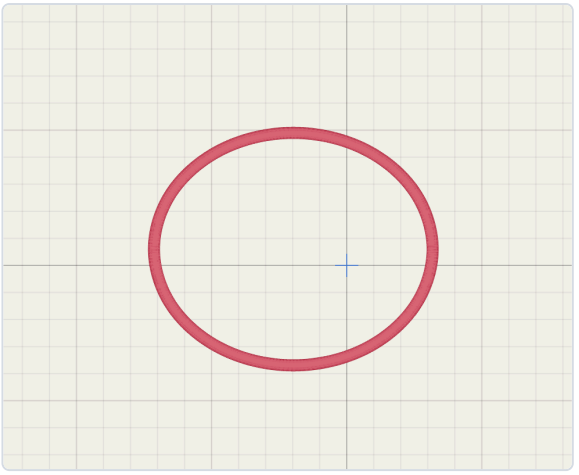

Classic monogram “RAS” in Chopin Script.

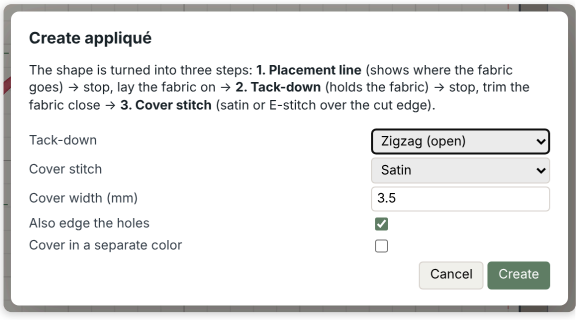

Appliqué

A piece of fabric is sewn on instead of filling – saves many stitches on large areas.

1. Draw the shape as a fill (or ellipse/rectangle).
2. Select the shape, **Edit → Appliqué from shape…**.
3. Choose tack-down stitch (zigzag, double running stitch, E-stitch) and cover (satin or E-stitch), **Create**.
4. At the machine: sew the **placement line** → lay on the fabric → **tack-down stitch** → trim the fabric at the edge → **cover**. The program sets stops in between automatically.

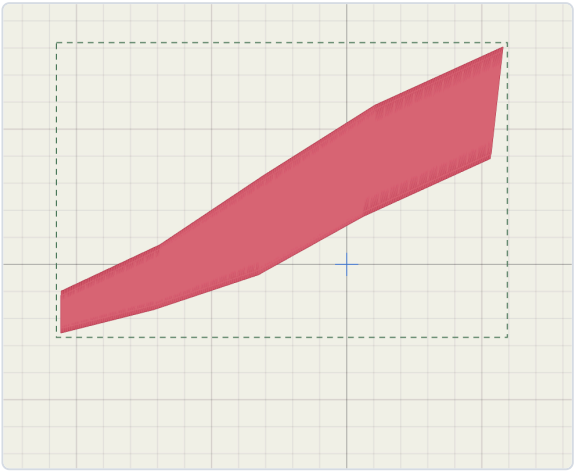

Result: placement, tack-down and cover stitch (fabric lies under the edge).

Satin with varying thickness (satin A)

When the line should be thick in some places and thin in others – e.g. for leaves or lettering.

1. Choose the tool **Satin A**.
2. Click the opposite edges alternately: side 1, side 2, side 1, side 2 …
3. Left click = corner, right click = curve. `Enter` ends.
4. Rework with **Reshape**.

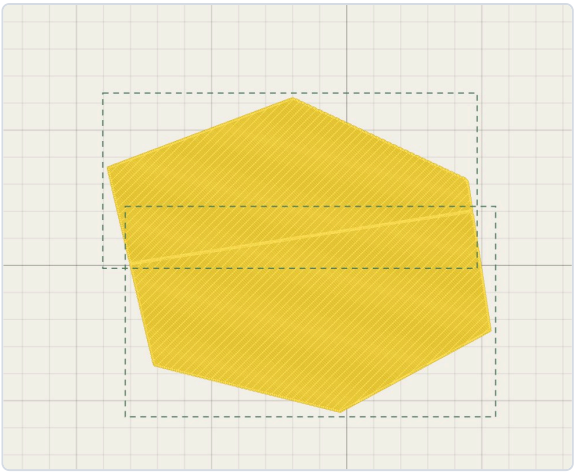

From thin to thick.

Splitting a fill with the knife

Cut a large fill into two parts – e.g. for two stitch angles or two colors.

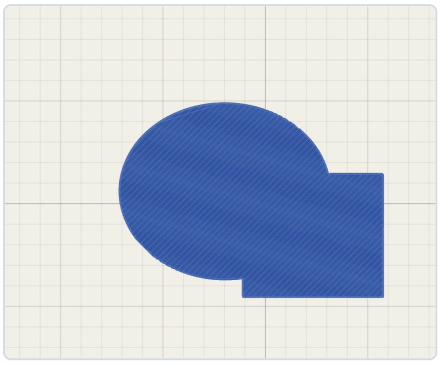

1. Draw a fill.
2. Tool **Knife**, draw a line through the fill, `Enter`.
3. Select both parts individually and change e.g. the color or the stitch angle.

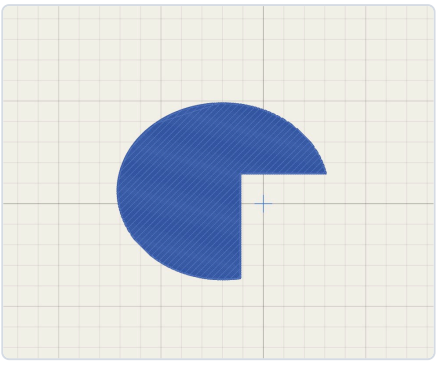

The fill was split into two parts.

Combining shapes

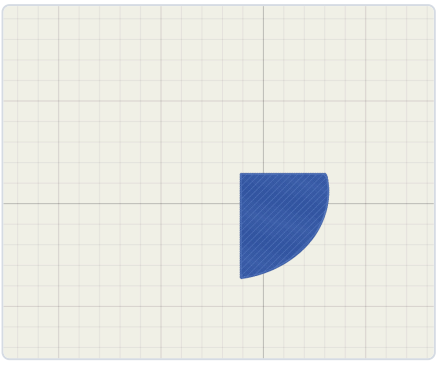

Make a new shape from several fills: Unite, Cut from bottom shape or Intersect (Edit menu). Select at least two fills.

Unite

Cut from bottom shape

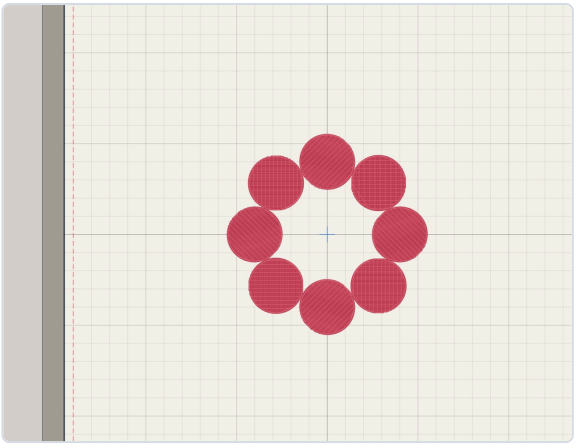

Intersect

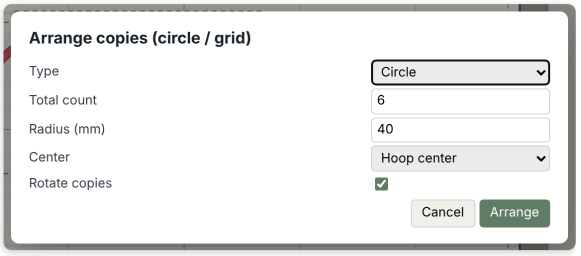

Copies in a circle (flower, star)

Arrange an element several times around a center point.

1. Draw an element (e.g. a circle as a petal) and select it.
2. **Arrange → Arrange copies…**: type “Circle”, count (including the original), radius.
3. Click **Arrange**. “Rotate copies” makes every copy point to the center.

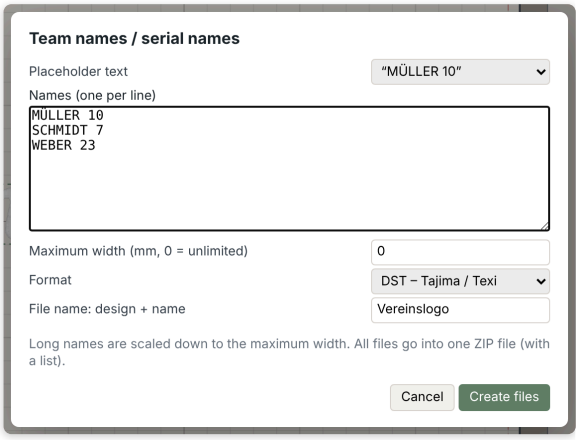

Eight copies in a circle.

Team names / serial embroidery

One design, many names – e.g. jerseys with player names.

1. Create a design with a **placeholder text** (e.g. “MUELLER 10”).
2. Select the text, **File → Team names / serial names…**.
3. Enter the list (one line per person), choose maximum width and format.
4. All files come in **one ZIP file**; font, size and position stay the same.

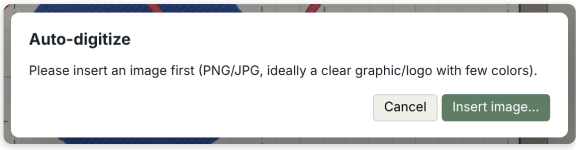

> 💡 **Tip** With the **maximum width** names that are too long are shrunk automatically.

Logo from an image (auto-digitizing)

A logo or graphic (PNG/JPG) is turned into embroidery objects automatically.

1. **Image → Insert image…** and choose the file. Clear graphics with few colors work best.
2. **Image → Auto-digitize…**: set number of colors, width, level of detail and stitch type.
3. Check the result and rework it with Reshape, color, order.
4. For logos as SVG, PDF or AI, **File → Import vector graphic…** is even more exact.

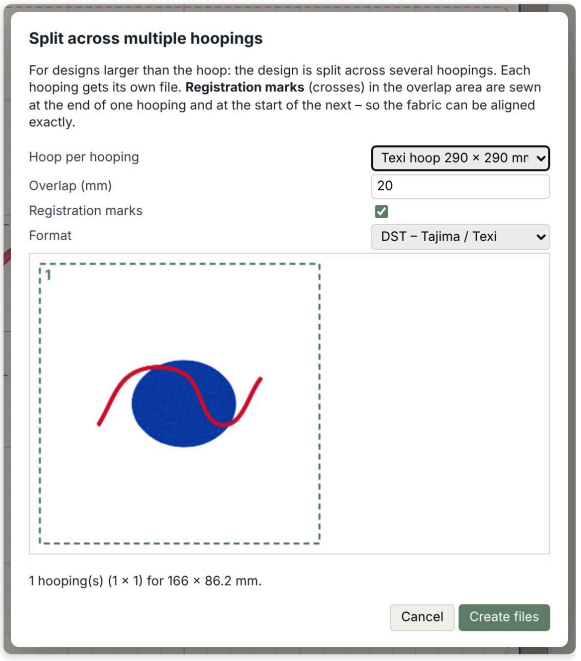

First insert an image, then digitize automatically.

Design larger than the hoop

The design is split across several hoopings, with registration crosses for alignment.

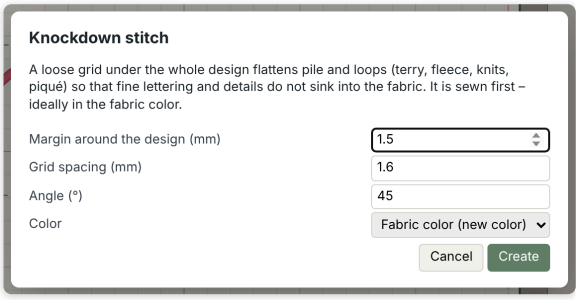

1. **File → Split across multiple hoopings…**.
2. Choose hoop, overlap (15–25 mm) and file format; leave registration marks switched on.
3. Each hooping produces one file. After re-hooping use the registration crosses for alignment.

With pile fabrics (terry, fleece)

Pile pushes between the stitches – details sink in.

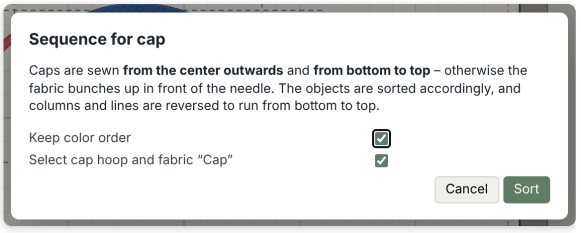

1. Choose “Terry” or similar as the fabric.
2. **Edit → Knockdown stitch…** lay a loose grid under the design (fabric color).
3. Additionally put on a water-soluble topper.

Embroidering caps

Caps need a special sewing order so that nothing distorts.

1. Finish the design.
2. **Edit → Sort for cap…**: order from the center outwards and from bottom to top; cap hoop and fabric are set at the same time.

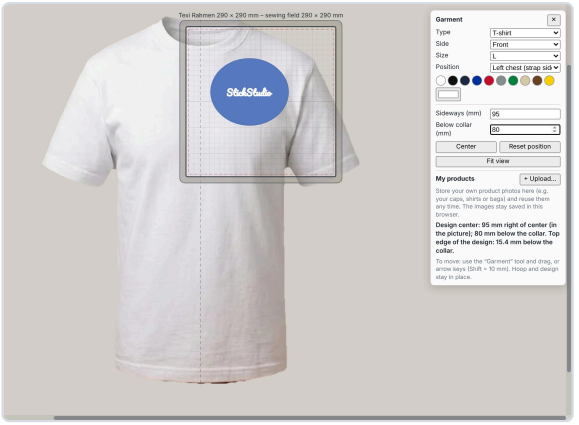

Placing a logo on the left chest

The logo should sit on the polo exactly where the customer wants it.

1. Finish the design and choose the hoop.
2. Choose the tool **Garment**, type **Polo**, side **Front**, position **Left chest**.
3. In the window set **Sideways** and **Below collar** to the customer's dimensions (e.g. 95 and 85 mm).
4. Check the top edge of the design in the window; then export and print the worksheet.

> 💡 **Tip** The dimensions are on the worksheet – so the logo always sits at the same place across the series.

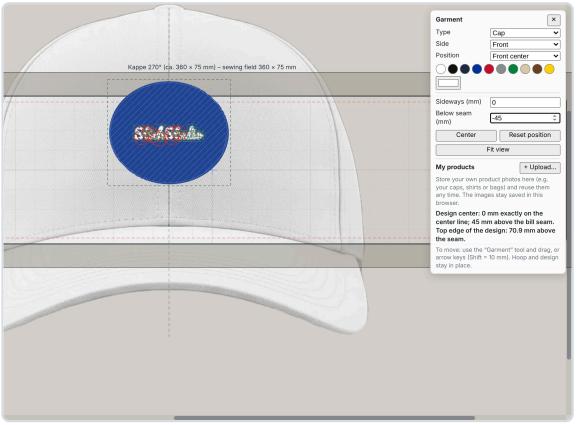

The design on the left chest.

Name on the cap

Text on the cap front, centered above the bill.

1. Choose the cap hoop, create the text.
2. Tool **Garment**, type **Cap**, side **Front**, position **Front center**.
3. Click **Center**; under **Below seam** enter about −45 mm (negative = above the bill seam).
4. For checking, choose the side view.

Design on the cap front.

11 Fonts

StickStudio contains 28 ready-digitized embroidery fonts and 9 more fonts that are converted to satin automatically. In addition, system fonts of the computer can be used.

All built-in embroidery fonts, sample “Name of the font”, 7.5 mm height.

📌 **Note** The licenses and authors of all fonts are listed in the online version under **Account → Licenses**. Most fonts are under free licenses (SIL OFL, CC-BY-SA); they may be used, but must not be sold under their own name.

💡 **Tip Minimum size:** satin lettering below 5 mm height becomes hard to read. Ready-made embroidery fonts suggest the recommended size. Fine script fonts (e.g. Chopin Script) need at least 20 mm.

12 Checking, machine and output

Stitch check

Green = all fine. Yellow/red = notes on density, angles, stitch lengths. Click to see details and fixes.

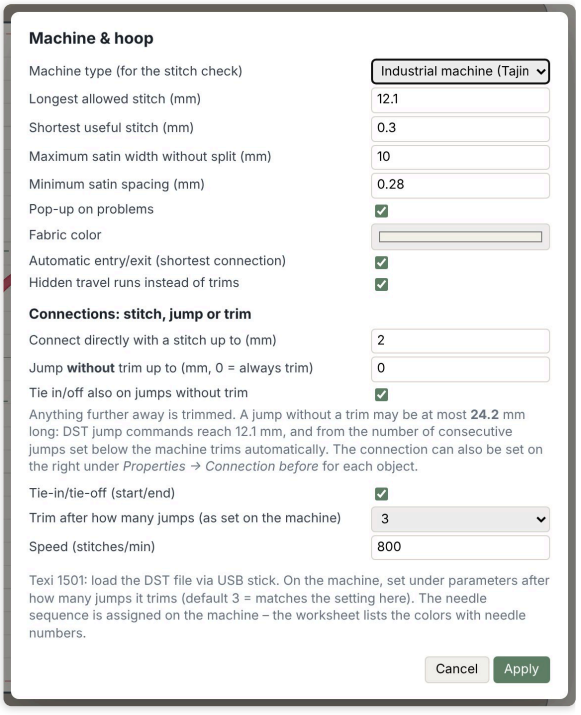

The check runs in the background after every change. It checks stitch lengths, density, satin widths, angles and whether the design fits into the hoop. With **Fix** problems are corrected with one click (e.g. aligning satin columns across the column or scaling into the hoop).

The limits depend on the machine type (industrial or home machine) and are found under **Settings → Machine, trims & jumps**.

Machine, trims & jumps

- **Connections:** if two objects are close together, sewing simply continues. At a larger distance the needle jumps or the thread is cut.
- **Hidden running paths:** instead of cutting, the thread runs under a fill that is sewn later to the next object.
- **Trim after ... jumps:** DST has no trim command – the machine trims after that many jumps in a row. Must match the machine (usually 3).
- **Lock stitches:** securing stitches at the start and end of every object.

Exporting

Creates the file for the embroidery machine. For the Texi 1501 choose “DST”, copy it to a USB stick and load it on the machine.

Format	Machines
DST	Tajima and all compatible industrial machines, **Texi 1501**, Ricoma, Barudan, ZSK ...

PES	Brother, Babylock
JEF	Janome
EXP	Melco, Bernina

> ⚠ **Caution** A **project file** (File → Save project) is **not** an embroidery file. The machine needs an exported DST/PES/JEF/EXP file. You keep the project file to change the design later.

Worksheet, mockup and price

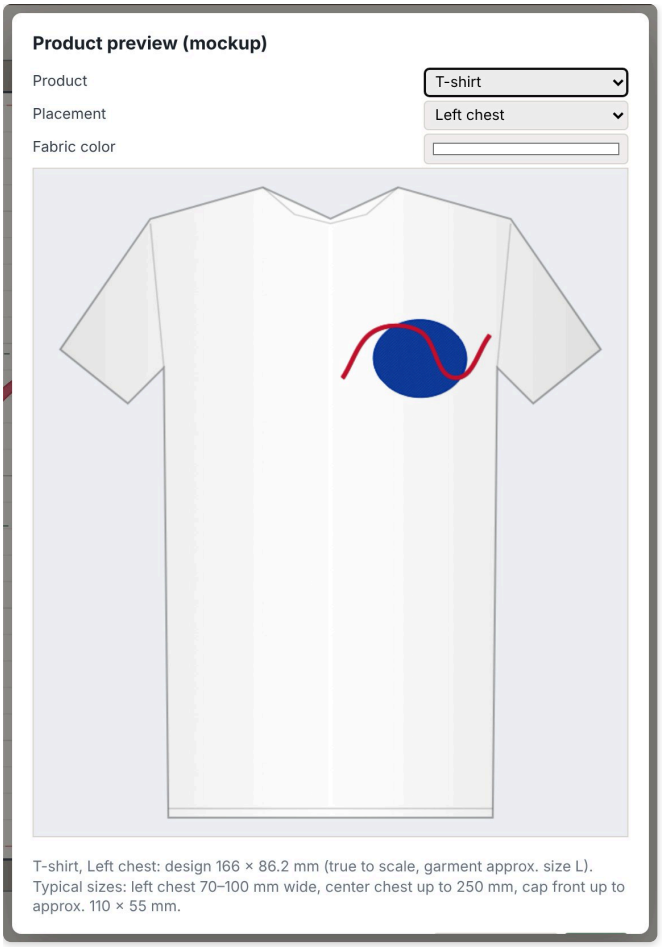

Print worksheet gives a sheet for the machine with preview, color sequence, needle numbers, stitch count, size, stabilizer recommendation and stops.

Product preview shows the design to scale on the garment (see Garment templates) or on a T-shirt, polo, hoodie, cap, towel or bag – useful for the conversation with the customer.

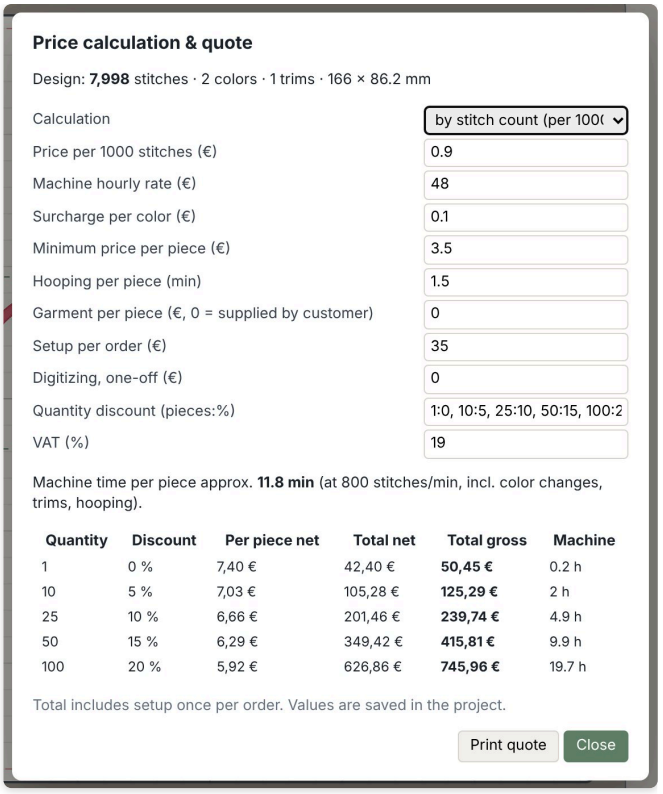

Pricing & quote calculates by stitch count or machine time with quantity discount and prints a quotation.

The worksheet (excerpt).

Product preview

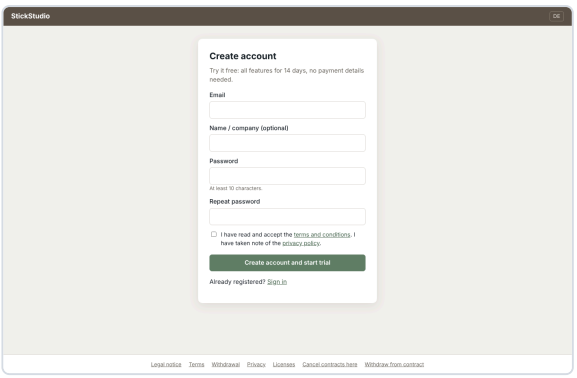

Price calculation

13 Account, trial and subscription

The online version runs on a server. You sign in with email and password and work in the browser. Your designs are stored safely in your account.

Registering and signing in

1. Click **Create account**, enter your email and a password of at least 10 characters.
2. Tick the box for **terms and conditions and privacy policy**.
3. With “Create account and start trial” you can start right away – without payment details.
4. Later: **Sign in**. Forgot your password? “Forgot password?” sends a link by email.

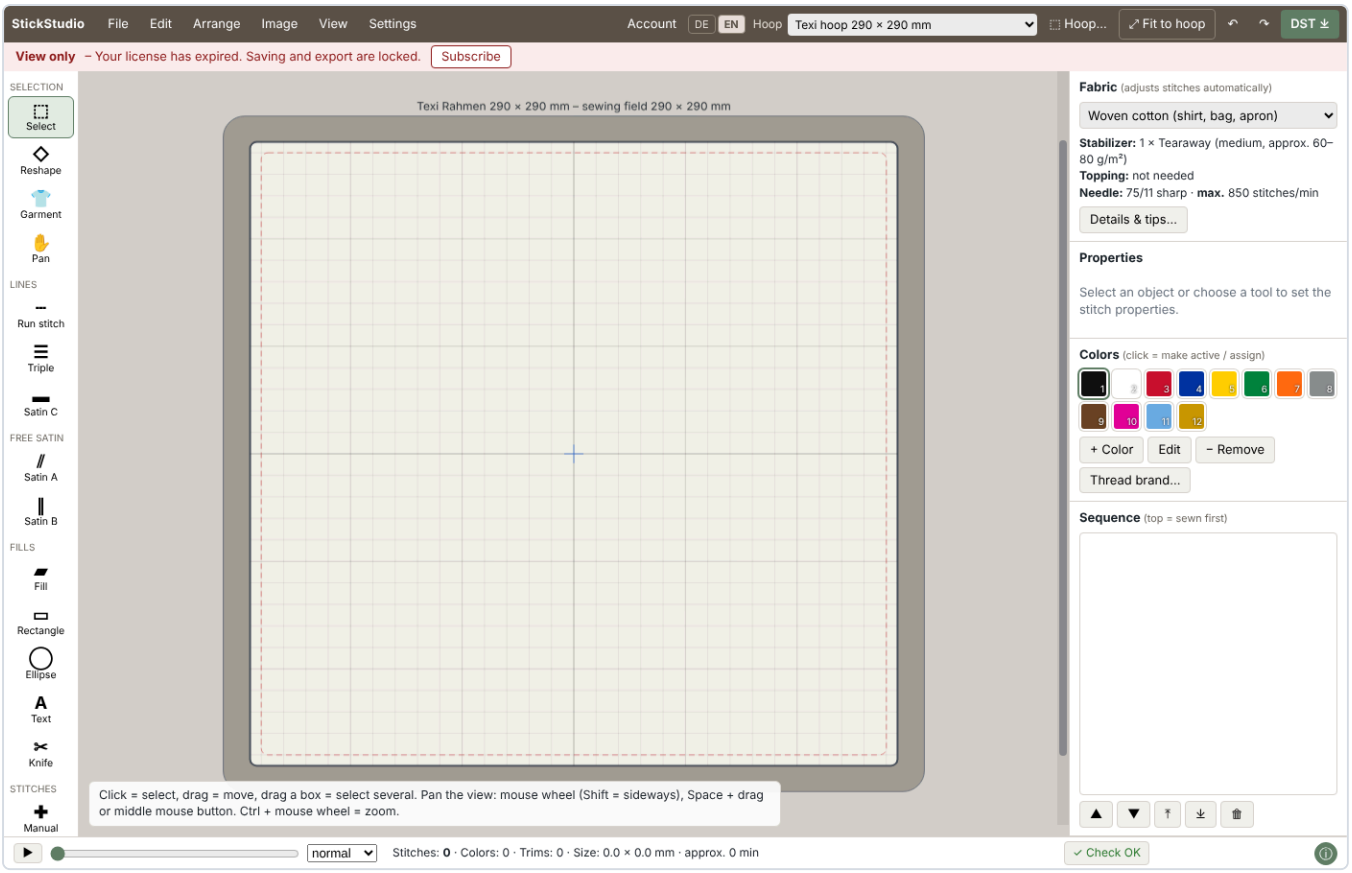

Registration

Trial and subscription

- **Trial:** after registering you can test all functions (14 days by default). A notice at the top of the program shows the remaining days.
- **Subscription: Subscribe** starts a secure payment process. After that your account is unlocked and renews automatically.
- **Manage subscription:** change the payment method and view invoices – in the customer portal, reachable via “My account → Manage subscription”.
- **Before every renewal** you get an email about two weeks in advance.

After expiry: view only

Without a valid subscription you can still **view** your designs, but no longer save, export or use team names and multiple hoopings. A red notice at the top reminds you. After taking out a subscription everything is unlocked again immediately.

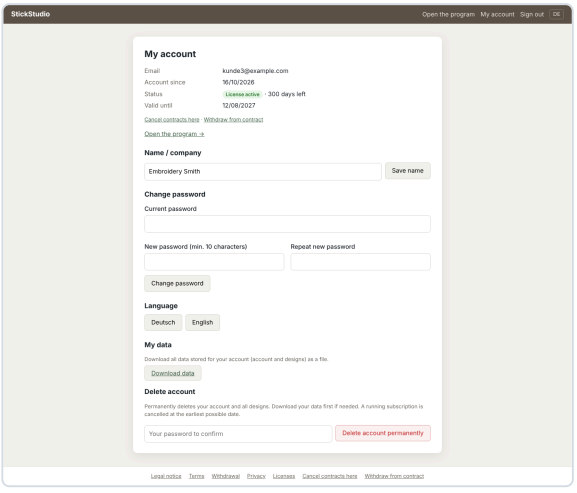

After expiry: notice “View only” and blocked export.

My account

Under **Account → My account**:

- Status, validity and subscription
- Change name, **change password**
- **Language** German / English
- **Download data** (all stored data as a file)
- **Delete account** (also ends a running subscription)

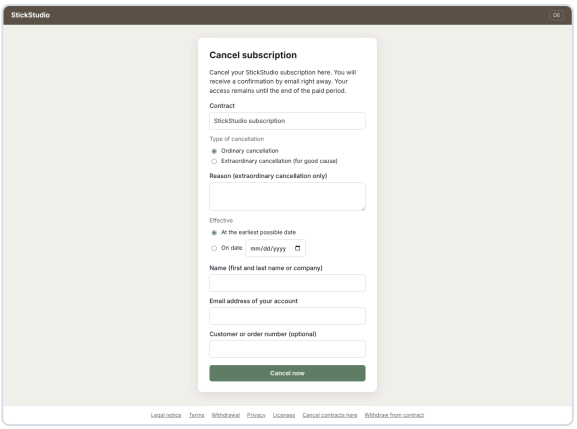

The “My account” page.

Cancelling and withdrawing

Both are possible **at any time** and linked at the bottom of every page: **“Cancel contracts here”** and **“Withdraw from contract”**. You do not need to be signed in. After sending, a confirmation with date and time appears immediately, and you receive it by email.

When you cancel, your access remains until the end of the paid period. Information about withdrawal is in the withdrawal policy.

The cancellation page.

Legal

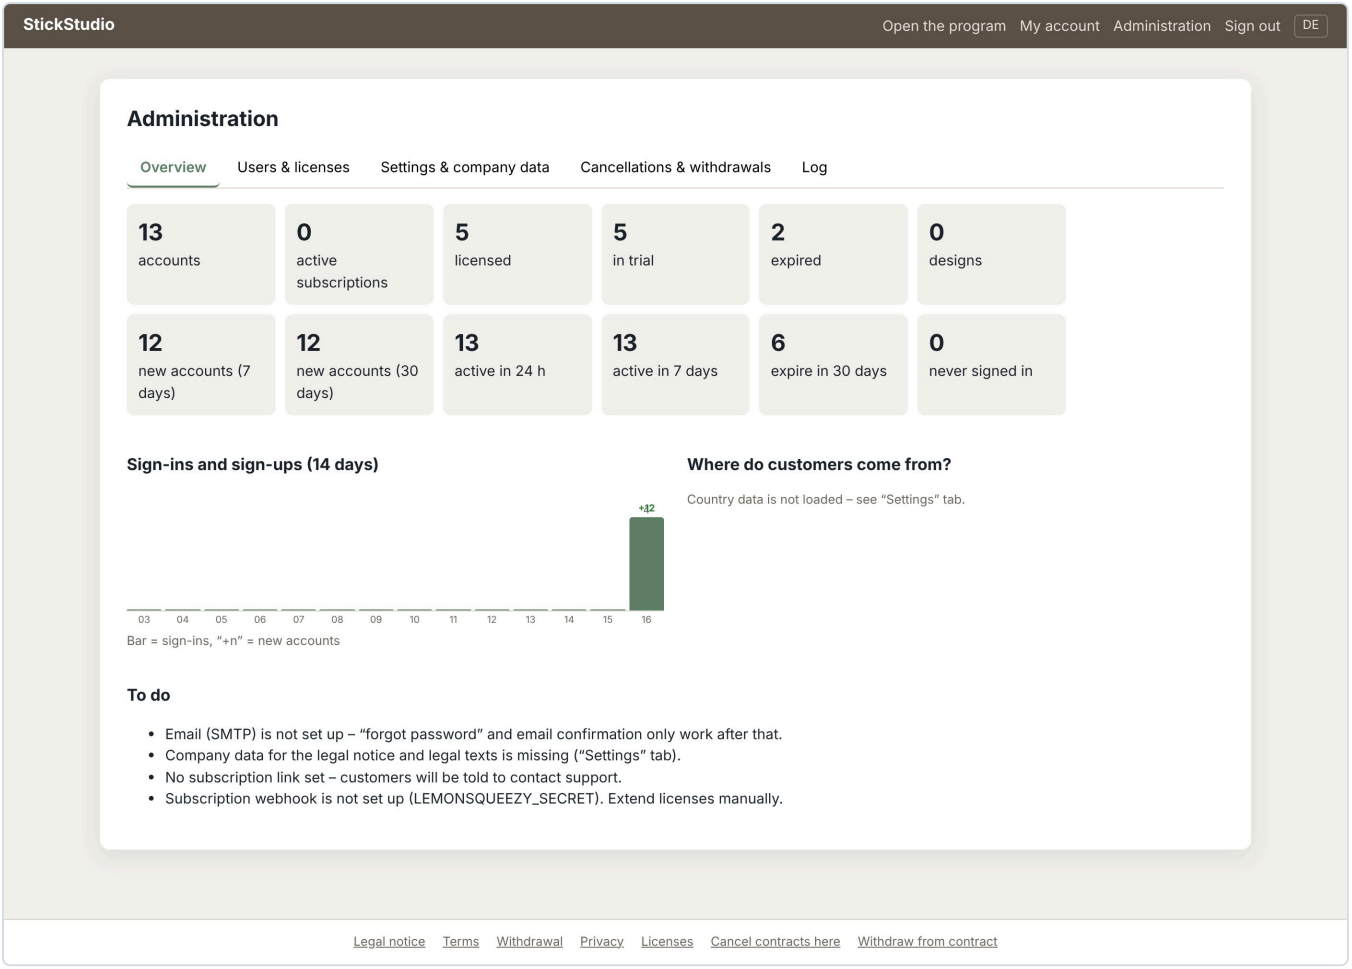

At the bottom of every page and in the “Account” menu: **Legal notice, Terms, Withdrawal, Privacy, Licenses**. Under “Licenses” all fonts and libraries are named with authors and licenses.

> 📌 **Note Privacy:** your designs belong to you and are stored only in your account. With “Download data” you can get a complete copy at any time, with “Delete account” they are removed.

14 Administration for the operator

As the operator you see all customers, who is in the trial, who has a subscription and where people sign in from. You find the area at **/admin** on your address (e.g. https://stick.your-company.com/admin) or in the program under **Account → Administration**. It is visible only to admin accounts.

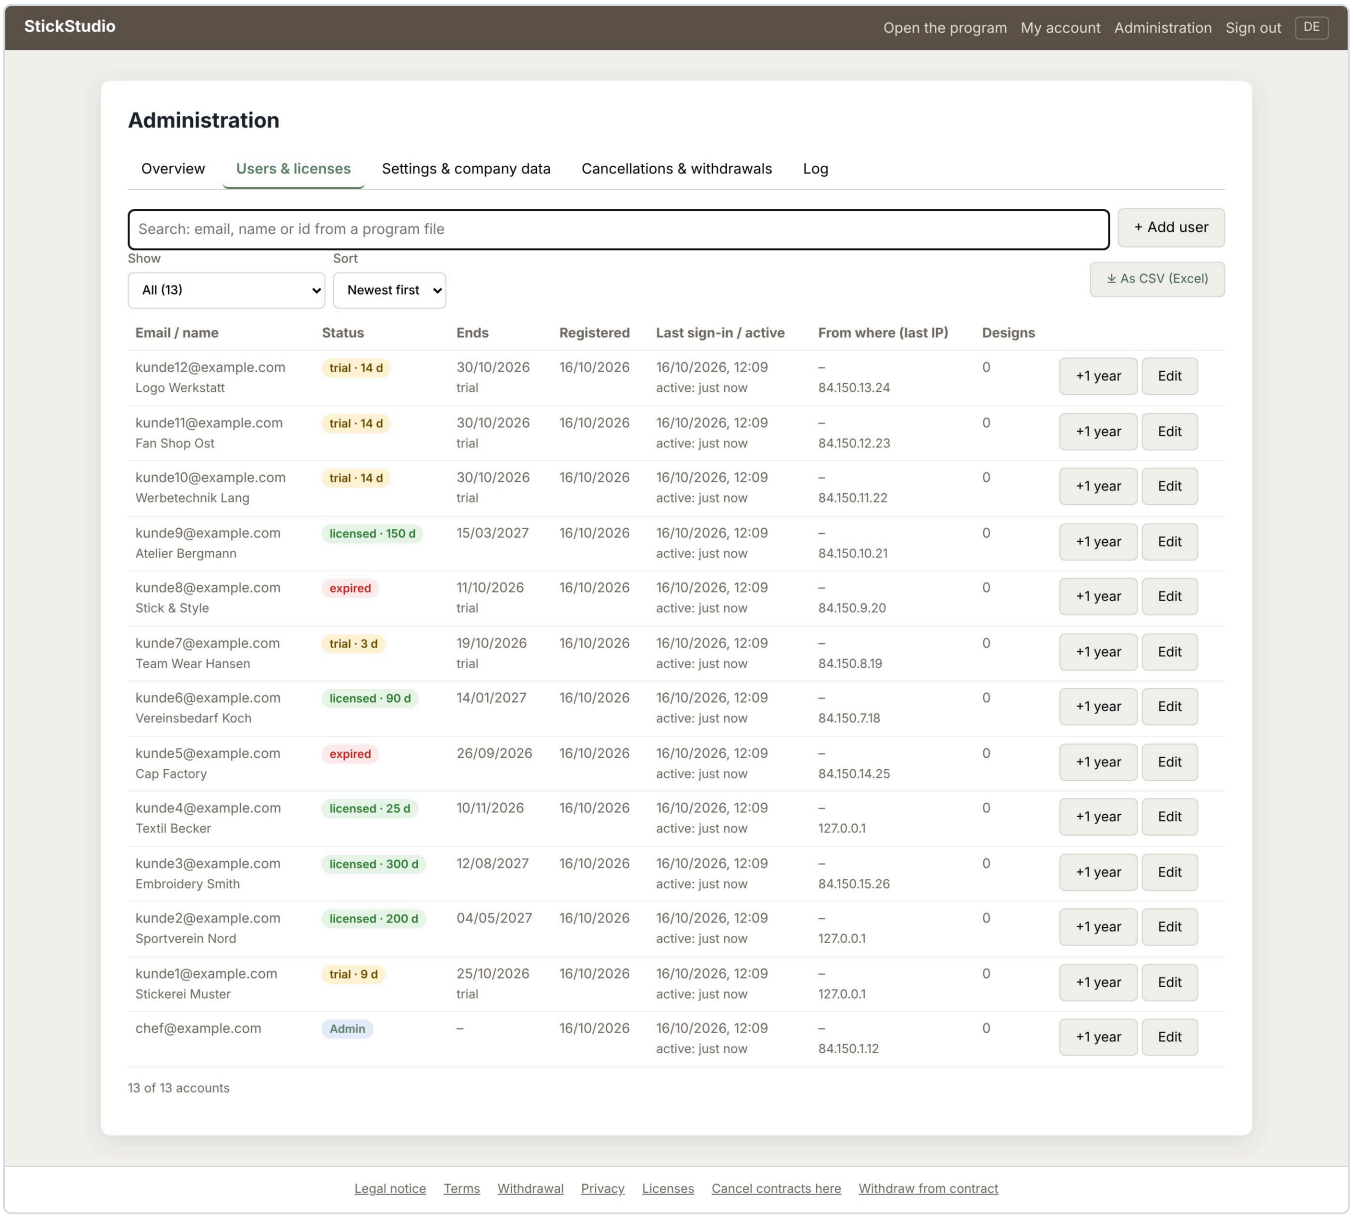

Overview

Numbers at a glance, sign-ups of the last 14 days and customers by country.

- **Accounts, subscriptions, trial, expired** and the number of designs.
- **New accounts** of the last 7 and 30 days, **active** in 24 hours and 7 days, **expiring soon**, **never signed in**.
- **Chart:** sign-ins per day, plus "+n" for new accounts.
- **Where customers come from:** country list with bars.
- **Still to do:** what is still missing for operation (email, company data, subscription connection, open cancellations).

Users and licenses

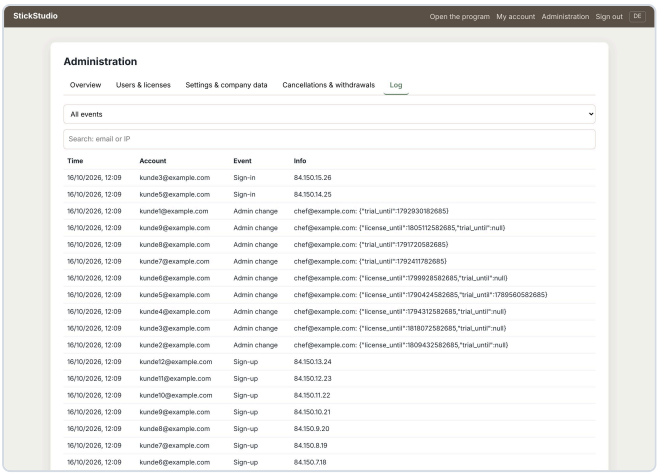

All accounts with status, expiry, last sign-in, country and IP address.

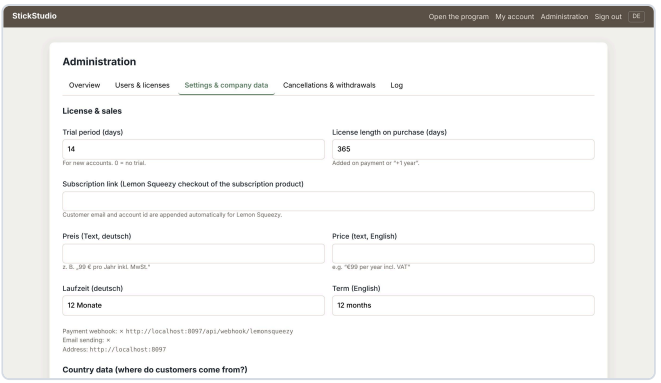

- **Filter:** All, trial, subscription active, license by hand, subscription cancelled, expired, expires in 30 days, never signed in, blocked, admin.
- **Sort** by newest, last active, expires first or email.
- **Columns:** status, expiry date, registration with country, last sign-in and activity, last IP address with country, number of designs.
- **+1 year** extends a license by hand, **Edit** opens name, periods, note, block, link for password reset and delete.
- **As CSV (Excel)** downloads the whole list.

> 📌 **Note** The IP address of every sign-in is stored and only the **country** is determined from it – not the place. The log is deleted automatically after 90 days. This is stated in the privacy policy.

Log, cancellations and settings

Log with filter by event, email or IP.

Settings: trial period, subscription link, country data, company data.

- **Log:** sign-ins, registrations, password changes, license and subscription changes, cancellations, withdrawals. Filter by type or search by email and IP.
- **Cancellations & withdrawals:** all cases received. You process open cases (end the subscription, refund if necessary) and mark them as done.
- **Settings:** trial days, subscription link, price, company data for the legal texts and the **country data** (button “Download now”; they renew themselves monthly).

15 Help with problems

The most frequent questions and what helps.

The stitches look like thick lines or are too dense.
You are zoomed in a lot – the display then shows every stitch line thick. With `0` (show everything) you see the design in real size. Also check whether the box “Adapt to fabric” is ticked under “Properties”.

The design sticks out over the sewing field.
Click **Fit to hoop** (top). The design is shrunk and all stitches are recalculated.

The check reports too dense areas.
Click “Check” at the bottom and choose **Fix**. A common cause: overlapping fills – then **Edit → Remove overlaps** helps.

I find no overlaps to remove.
The command checks every object under the ones lying above it. Select several objects (or nothing = all). The message after the command says what was checked and why nothing was changed.

I cannot scroll.
Mouse wheel = up/down, `Shift` +wheel = left/right, hold `Space` and move the mouse, the hand tool `H` or the bars at the edge. If you prefer to zoom with the wheel: “View → Mouse wheel zooms”.

The simulation always starts from the beginning.
When nothing is selected the whole design runs. With a selected object only that one runs.

The text is illegibly small.
Satin below 5 mm height becomes hard to read. Choose larger text or a font with simpler letters.

I cannot save or export.
Probably the trial or the subscription has expired. The notice “View only” then appears at the top. With “Subscribe” everything is free again immediately.

The machine does not read the file.
For the Texi 1501 choose the format **DST**. Keep file names short and without special characters, copy the file directly onto the stick (not into a subfolder).

Where are my designs?
Under **File → Design library**. In the online version they are in your account and reachable from any computer.

I deleted something.
`Ctrl` + `Z` undoes it, pressing it several times goes further back.

The garment does not appear.
The photo takes a moment to load. Then click “Fit view” in the Garment window. If the window is closed, switch it on again via **File → Garment template…** or with the tool “Garment”.

The millimeters on my own photo are wrong.
In the window choose “Set scale”, click two points with a known distance and enter the real length. The farther apart the points are, the more exact.

My products are gone on the other computer.
They are stored only in the browser in which you uploaded them. Upload them there again.

A button does nothing.
Some commands need a selection (e.g. “Combine shapes” at least two fills). The message in the dialog says what is missing.

16 Glossary

Term	Meaning
Appliqué	A piece of fabric sewn on and fastened with stitches at the edge.
Density	Distance between the stitches. Small distance = denser embroidery.
DST	Embroidery file format from Tajima, read by almost all industrial machines.
Garment template	Photo of a garment behind the hoop to determine the embroidery position.
Hooping	The piece of fabric that is clamped in the hoop.
Jump	The machine moves on without sewing. The loose thread may have to be cut off.
Knockdown	A grid under the design that flattens pile or loops.
Pull compensation	Compensation for the thread pulling the fabric together – the shape is drawn slightly wider.
Reference point	Point from which distances are measured (collar or bill seam).
Registration mark	Small cross with which several hoopings are aligned exactly.
Running stitch	Simple stitch line, stitch after stitch.
Satin	Stitches lying close together from edge to edge – glossy, for lines and lettering.
Sewing field	The area in the hoop in which sewing is possible.
Stabilizer	Embroidery backing under the fabric that stabilizes it (e.g. tear-away).
Tack-down stitch	Stitches that hold the appliqué fabric in place temporarily.
Tatami	Fill stitch of offset rows for large areas.
Thread trim	The machine cuts the thread before moving to the next object.
Topper	Water-soluble film on top of the fabric so that stitches do not sink into pile.
TrueView	Thread view: display of the stitches like real thread with gloss.
Underlay	Stitches under the satin or fill that stabilize the fabric.
